

PCI for In-Stent Restenosis

CardioVascular Research Foundation

Summit TCT Asia Pacific 2007

ISR of BMS

CardioVascular Research Foundation

Summit TCT Asia Pacific 2007

Patterns of In-Stent Restenosis

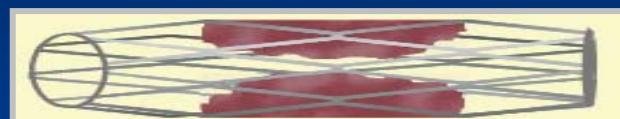

Pattern I : Focal

Type IA: Articulation / Gap

Type IB: Marginal

Type IC: Focal body

Type ID: Multifocal

Pattern II, III, IV : Diffuse

Pattern II : Intra-stent

Pattern III: Proliferative

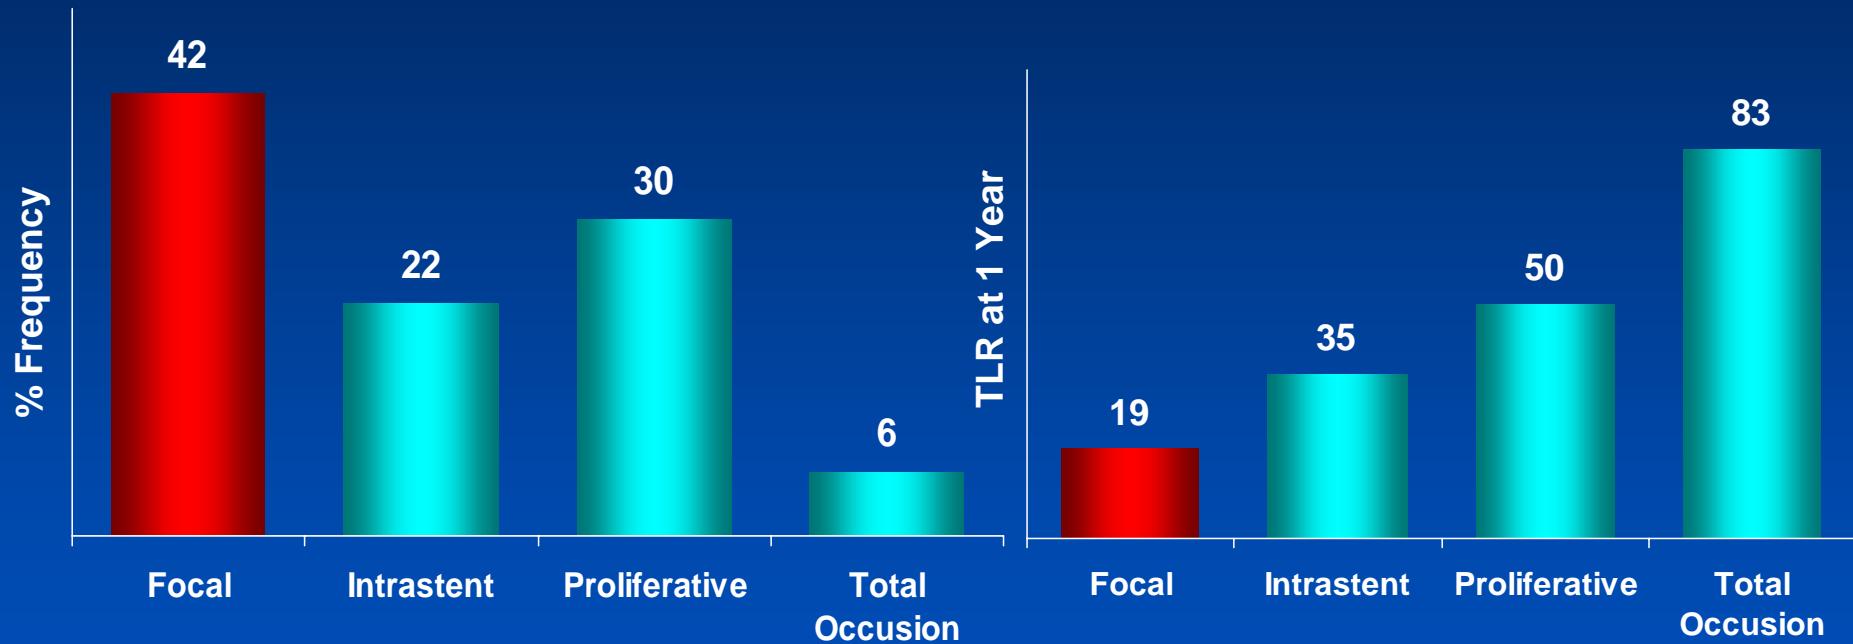

Pattern IV : Total occlusion

Mehran R. Circulation 1999;100:1872 -8

Patterns of ISR

282 Lesions

Predictors of TLR: diabetes, previous ISR and ISR patterns

Mehran R. Circulation 1999;100:1872-8

Treatment of BMS-ISR

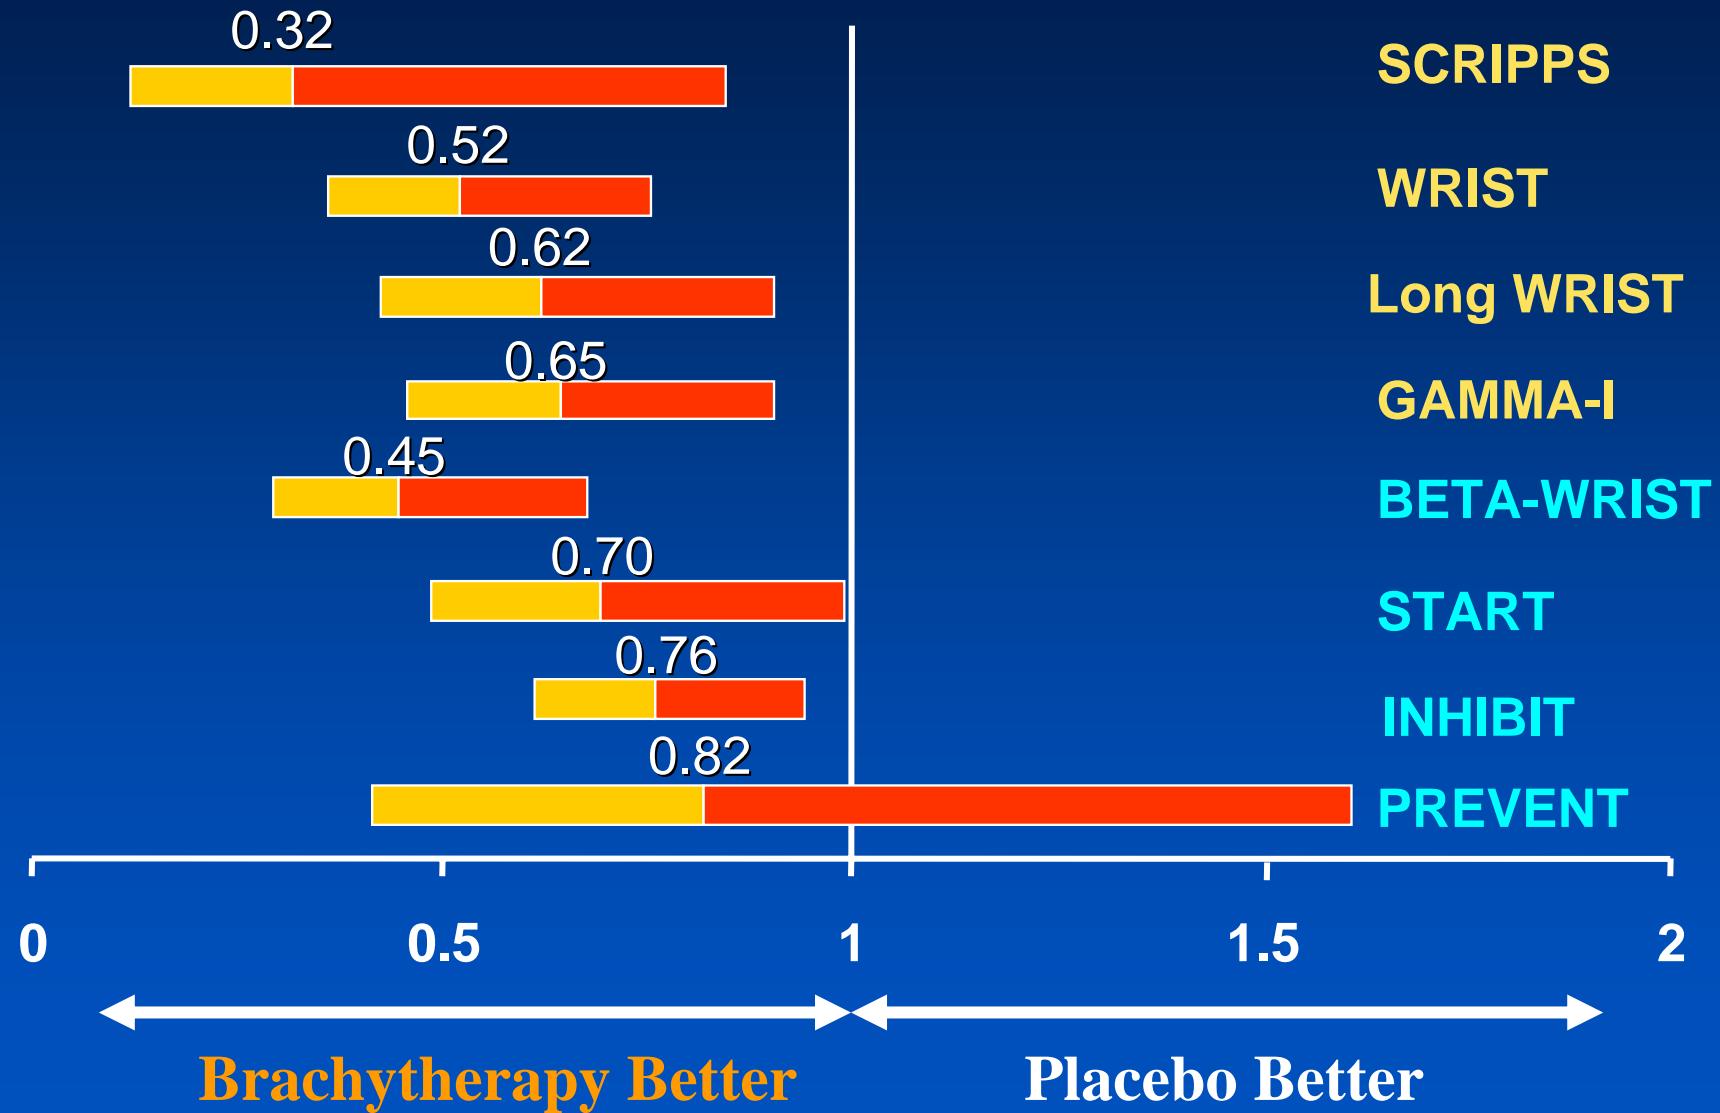

- Balloon angioplasty
 - Cutting balloon angioplasty
 - Rotablating atherectomy
 - Repeat stenting
 - **Intracoronary brachytherapy**
 - **Drug-eluting stent**
- 
- Not encouraging in diffuse ISR

Intracoronary Brachytherapy

- Most effective therapy of in-stent restenosis before development of DES
- Use of source train or balloon with beta or gamma radiation
- Inhibition of neo-intimal growth

Risk Reduction of Brachytherapy

Brachytherapy

Reported Clinical Trials for ISR

Trials	Source	Length (mm)	Pts (n)	Restenosis (%)

DES for BMS ISR

Angiographic Restenosis

Dibra A. JACC 2007;49:616-23

CardioVascular Research Foundation

Summit TCT Asia Pacific 2007

Conclusions

- The superiority of DES for bare-metal ISR is derived from the greater acute gain and similar to or lower late loss than that of brachytherapy.
- Drug-eluting stent has become the first-line therapy for bare-metal ISR replacing the brachytherapy.

Conclusions

- Among the DESs, the SES may be more effective in reducing the recurrent restenosis and improving clinical outcomes in treatment of bare-metal ISR.
- The superiority of SES over brachytherapy for treatment of bare-metal ISR was maintained to 2 years.

SES for SES Restenosis

Asian Multicenter Registry

The use of SES in SES-ISR was safe with low complication and low incidence of restenosis.

Randomized Trials of ISR

CardioVascular Research Foundation

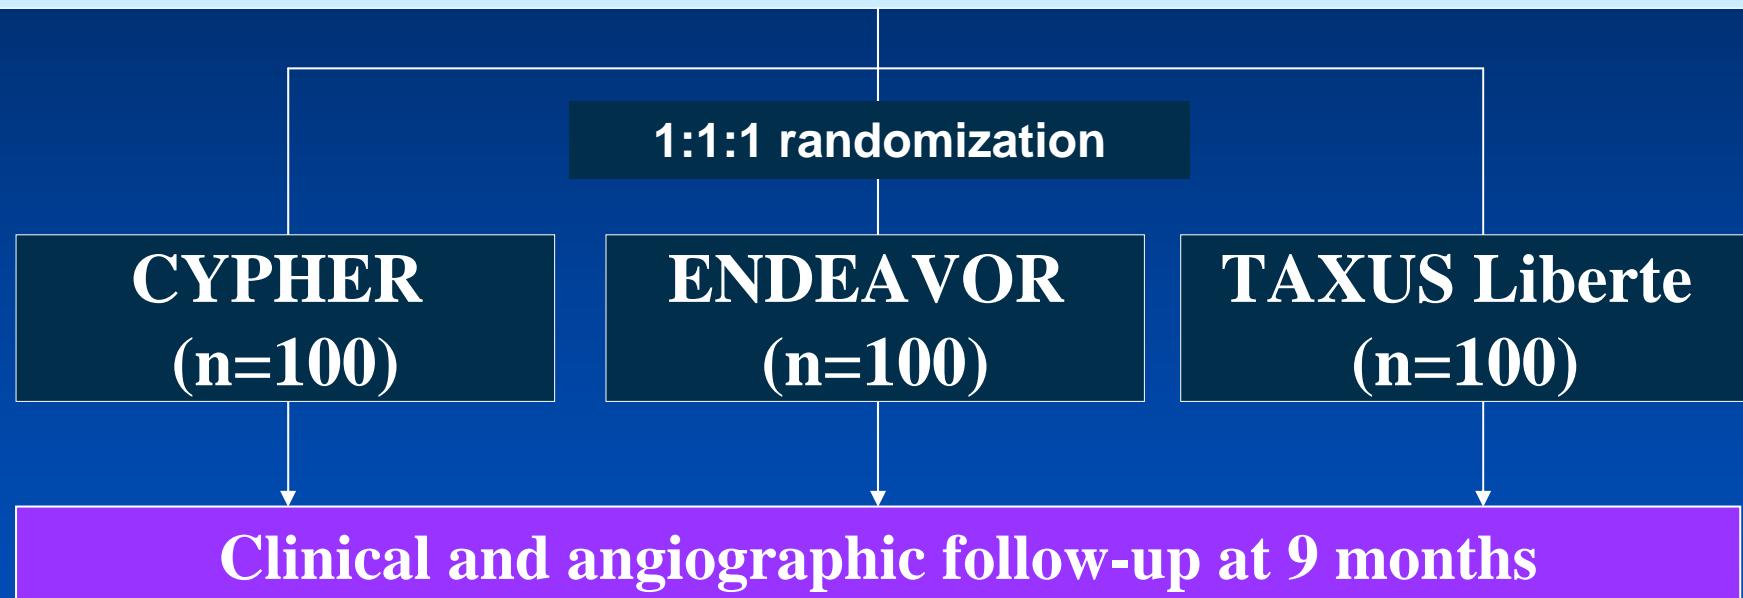

Summit TCT Asia Pacific 2007

***DIFFUSE* Type *In-Stent Restenosis*
after Drug-Eluting Stents
Implantation Treated by Additional
Drug-Eluting Stents: **Sirolimus-**
Eluting Stent vs. Paclitaxel-Eluting
Stent and vs. Zotarolimus-Eluting
Stent**

DIFFUSE-ISR 3 Trial

Diffuse Type In-Stent Restenosis (Lesion Length \geq 10mm) After Drug-Eluting Stent Implantation
(Total 300 patients)

Primary end point: (1) Binary angiographic restenosis at 9 months

**FOcal In-stent Restenosis after
Drug-Eluting Stent Implantation
Treated by Cutting Balloon
Angioplasty versus Sirolimus-
Eluting Stent**

FOCUS Trial

Focal In-Stent Restenosis (Lesion Length \leq 10mm) After Drug-Eluting Stent Implantation
(Total 200 patients)

1:1 randomization

**Sirolimus-Eluting Stent
(n=100)**

**Cutting balloon
(n=100)**

Clinical and Angiographic follow-up at 9 months

Primary end point: (1) Binary angiographic restenosis at 9 months

Conclusions

- The effective treatment of ISR within DES has not been sufficiently studied.
- Up to now, the effectiveness of conventional angioplasty for the focal ISR after DES may be acceptable and comparable to repeat DES implantation.

Conclusions

- Repeat DES treatment with same or different antiproliferative agents appears to be effective treatment option for DES failure
- Further larger trial is needed for delineating the role of DES, conventional treatment or brachytherapy for treatment of DES failure.

Recommended Strategy to Treat DES ISR
