- **BostonScientific**
- **Volcano**

- Today, in reality, almost everything that we currently know about vulnerable plaque has come either from histopathology or from in vivo detection of plaque rupture or study of patients who present with acute coronary syndromes - *NOT from prospective correlative studies or prospective identification of vulnerable plaques before they rupture, rapidly progress, or thrombose.*

0 —————> 1mm —————> 4mm

300 plaque ruptures in 257 arteries of 254 pts

- Asymptomatic
- Stable angina
- Peri MI

Tear in fibrous cap identified in 59%:
at shoulder of plaque in 68% in center of
plaque in 32%

The frequency of stable angina or no symptoms in patients with plaque rupture suggests that asymptomatic rupture and healing are common and may be one of the mechanisms of progression of CAD

Maehara et al J Am Coll Cardiol 2002;40:904-10

Location of 273 ruptured plaques in 158 patients with ACS and 48 patients with stable angina and three vessel IVUS

Hong et al JACC 2005;46:261-5

Three Vessel IVUS Imaging in 24 Pts with ACS and Positive Tn

- 50 ruptured plaques
 - 9 culprit lesion
 - 41 nonculprit lesion
- 19 pts had at least 1 nonculprit plaque rupture (79%)
 - 17 pts had 1 plaque rupture in a second artery
 - 3 pts had plaque ruptures in all 3 arteries

Rioufol et al Circulation 2002;106:804-808

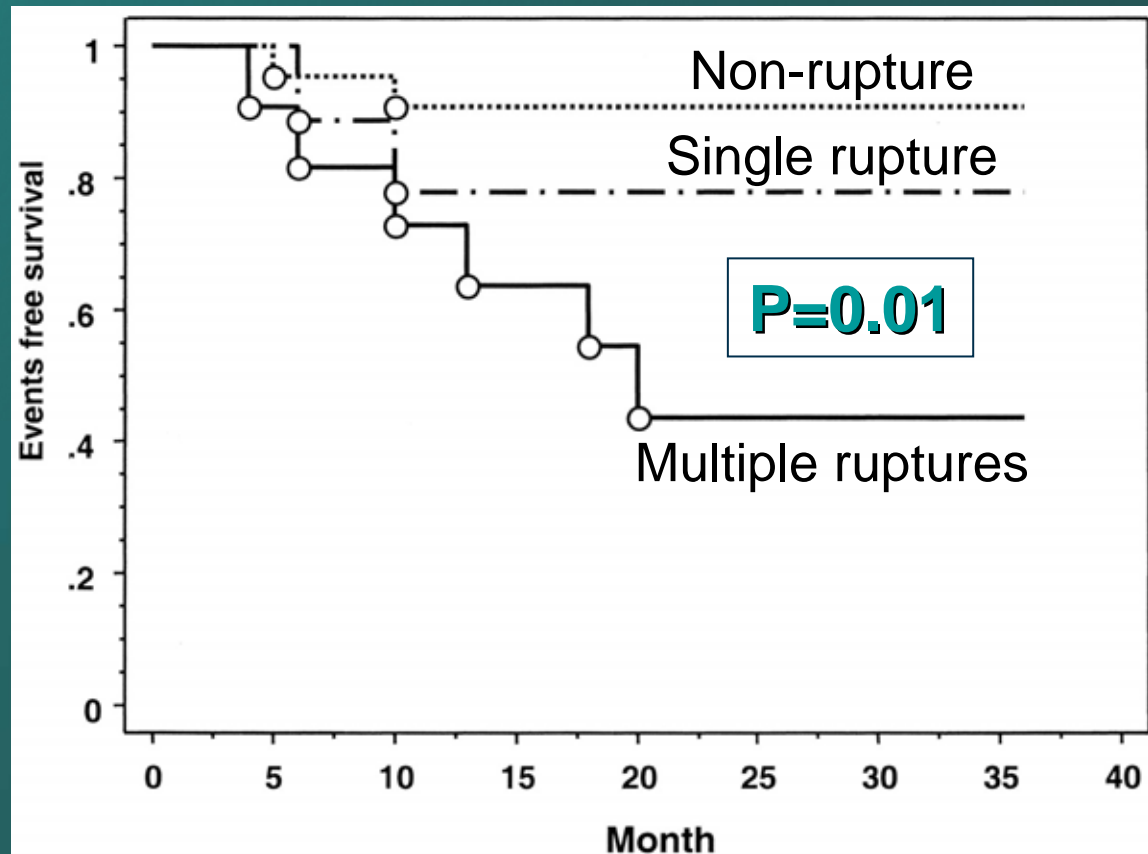

Frequency of ruptured plaques in 122 patients with MI and 3-vessel IVUS

Hong et al Circulation 2004;110:928-337

IVUS in 129 arteries of 45 1st MI patients

- Culprit plaque rupture in 21 pts (47%)
- Secondary plaque rupture in 11 pts (24%)
- hs-CRP correlated with # of plaque ruptures ($p < 0.01$)

Tanaka et al. *J Am Coll Cardiol* 2005;45:1594-9

What is the fate of non-flow-limiting ruptured plaques

- 14 pts with 28 plaque ruptures with MLA $>4.0\text{mm}^2$ treated with statins and dual antiplatelet therapy
 - At 22 ± 13 months, half had healed with no clinical events
 - (Rioful et al. Circulation 2004;110:2875-80)
- 28 pts with non-culprit plaque ruptures (only half treated with statins) were followed for 11.9 ± 1.3 months
 - Statin-treated patients had a decrease in plaque area of $0.6\pm 0.8\text{mm}^2$ (vs an increase of $0.3\pm 0.7\text{mm}^2$ in controls, $p=0.005$).
 - Complete healing was observed in 4 (29%) statin-treated vs no control patients ($p=0.049$).
 - Target lesion revascularization was performed in 3 control (21%) vs no statin-treated patient ($p=0.11$).
 - Lesions requiring revascularization had a decrease in lumen area ($-1.7\pm 1.4\text{mm}^2$ vs $0.1\pm 0.8\text{mm}^2$, $p=0.001$) as well as an increase in plaque area ($1.1\pm 1.0\text{mm}^2$ vs $-0.3\pm 0.7\text{mm}^2$, $p=0.04$).
 - (Hong et al. Unpublished results)

Arad et al. *J Am Coll Cardiol* 2000;36:1253-60

Calcium is an index of plaque volume

IVUS arc of calcium (°)

Volumetric index of total calcium

Mintz et al. *J Am Coll Cardiol* 1997;29:268-74

Tinana et al. *Am J Cardiol* 2002;89:757-60

72±12% of plaque volume (range 46-86%) is in non-stenotic segments

	Lesion	Non- Stenotic Segment	p
EEM vol (mm ³)	119 ±111	459 ±283	<0.0001
Lumen vol (mm ³)	29 ±30	228 ±156	<0.0001
P&M vol (mm ³)	90 ±86	231 ±140	<0.0001
Length (mm)	9.4 ±7.6	33.4 ±13.5	<0.0001

- The likelihood of developing acute coronary syndromes correlates with coronary plaque burden
- Vulnerable and ruptured plaques arise from non-stenotic segments where most of the plaque burden resides
- Measures of plaque burden - such as calcium - may, therefore, be indirect indices of vulnerable plaques.

Tinana et al. Am J Cardiol 2002;89:757-60

Patterns of Calcification

	MI (n=61)	Unstable angina (n=70)	Stable angina (n=47)
No calcification	26%	41%	21%
Spotty calcification	51%	40%	30%
Intermediate calcification	15%	16%	11%
Extensive calcification	8%	3%	38%

p<0.0001

- Spotty calcification=lesion with only small calcium deposits <90°
- Intermediate calcification=arc of calcium of 90-180° in at least one cross-section
- Extensive calcification=arc >180° in at least one cross-section

Ehara. Circulation 2004;110:3424-9

Clinical Follow up in 357 intermediate lesions in 300 pts deferred intervention after IVUS imaging

Arc of Ca ⁺⁺	46.9±51.2	1.09	0	106.7

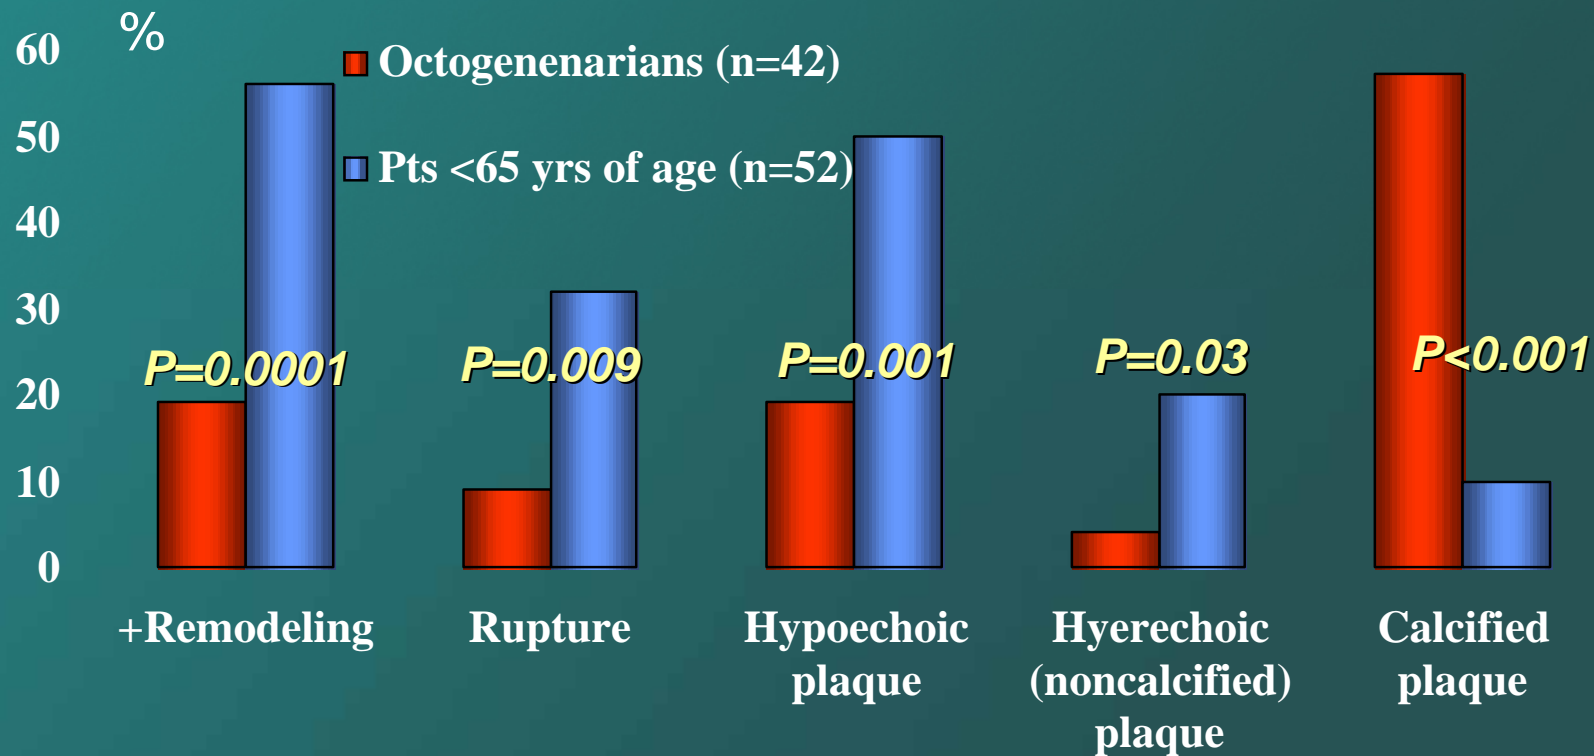

- Using the five variables with the narrowest coefficient of variance, 67% of 112 ruptured plaques fit all of following 10th or 90th percentile parameters
 - >14.3mm² lesion EEM area
 - >8.1mm² reference lumen area
 - >1.6mm maximum lesion plaque thickness
 - >0.63 lesion plaque burden
 - >0.87 remodeling index).
- 89% fit 4 of these 5 parameters
- 96% fit 3 of these 5 parameters.

Fujii et al (unpublished)

Not all vulnerable plaques fit the standard definition of a thin-cap fibroatheroma (TCFA)

Negative remodeling and calcified plaque are more common in octogenarians with acute myocardial infarction
