Effects of Statin Treatment on Ruptured Coronary Plaques

Myeong-Ki Hong, MD, PhD

Asan Medical Center, Seoul, Korea

Underlying Pathologies of "Culprit" Coronary Lesions

- Ruptured plaques (70%)
  - Stenotic (20%)
  - Non-stenotic (50%)
- Non-ruptured plaques (30%)
  - Erosion
  - Calcified nodule
  - Others/Unknown

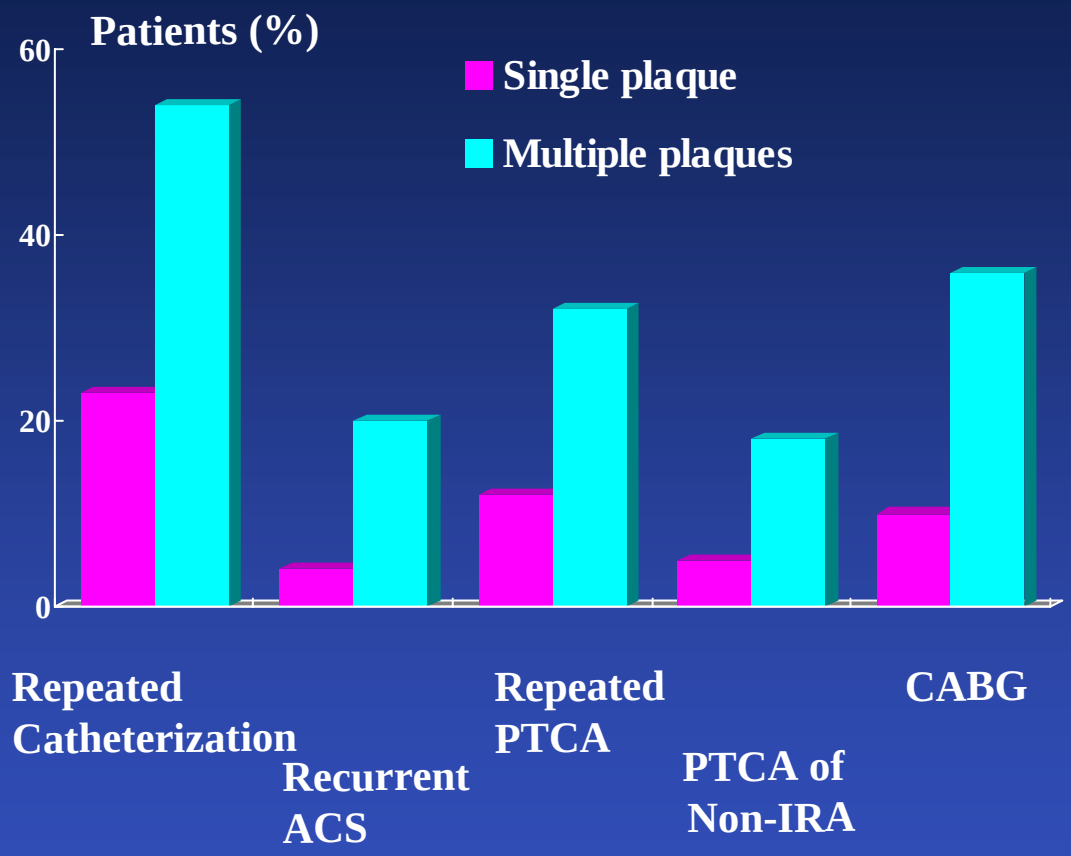
Naghavi M. Circulation 2003; 108: 1664-72

Angiographic Study

One previous study using coronary angiography:

1. 40% of patients with an AMI had multiple complex plaques,

2. These patients had an increased incidence of recurrent ACS, repeat intervention (particularly of non–infarct-related lesions), and CABG in the subsequent year.



Goldstein JA, et al. *N Engl J Med.* 2000; 343:915–922.

Angioscopic study

Long-term Prognosis of Plaque Rupture

Recent publications about long-term prognosis about plaque rupture

- **Evolution of spontaneous atherosclerotic plaque rupture with medical therapy: long-term follow-up with intravascular ultrasound.**

  Rioufol G, et al. *Circulation* 2004; 110:2875-2880.

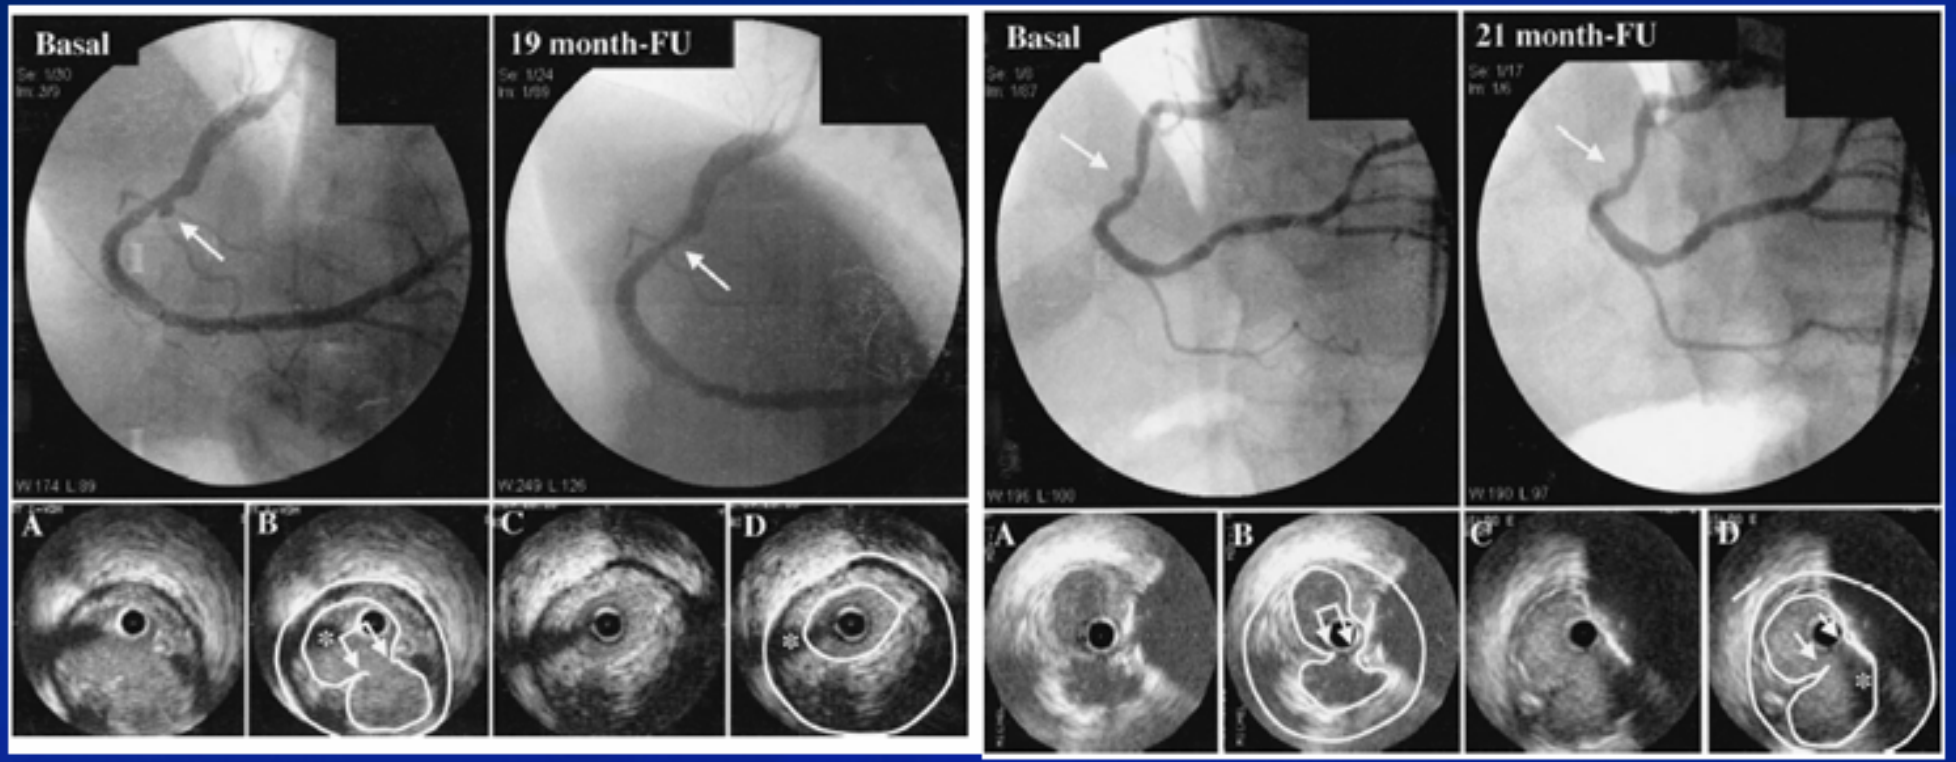
- **Angioscopic follow-up study of coronary ruptured plaques in nonculprit lesions.**

  Takano M et al, *J Am Coll Cardiol* 2005;45:652– 8

- **Cardiovascular events in patients with coronary plaque rupture and nonsignificant stenosis.**

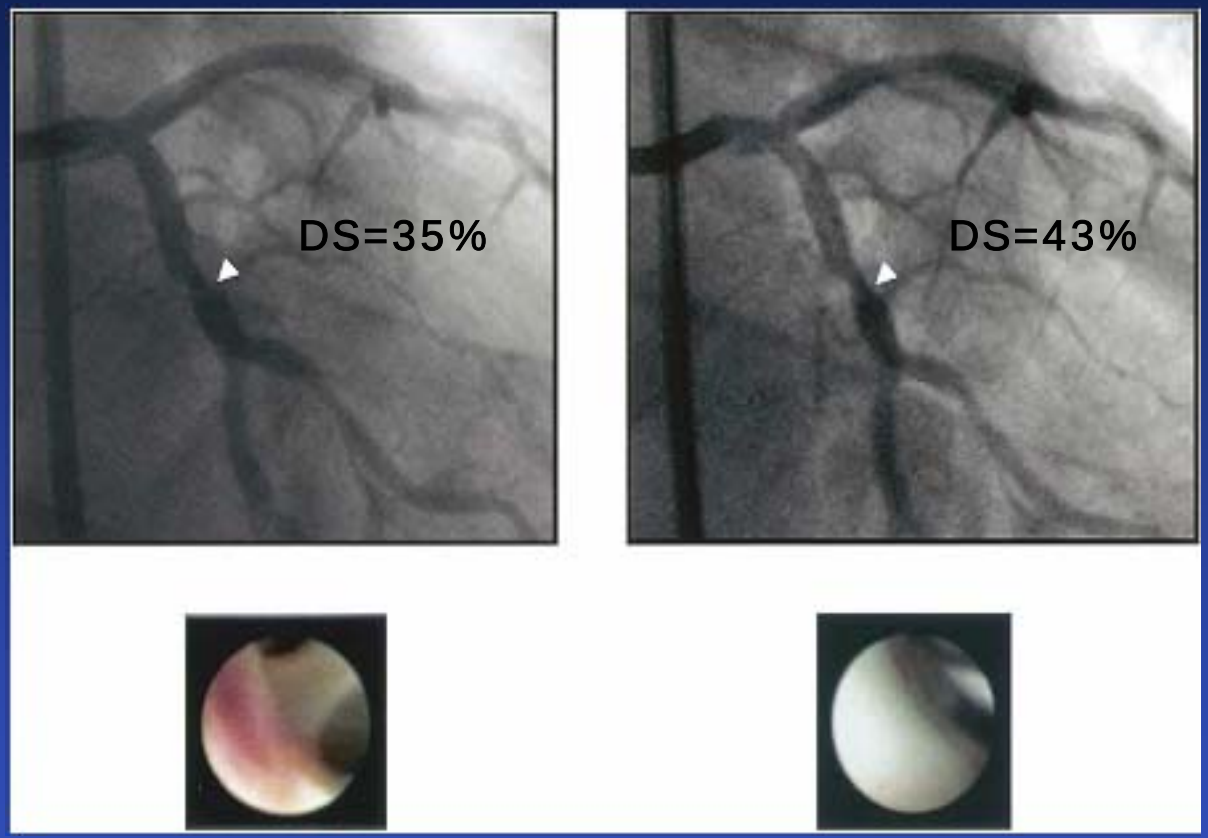
  Ohlmann P, et al, *Am J Cardiol* 2005;96: 1631-1635

Evolution of Spontaneous Atherosclerotic Plaque Rupture With Medical Therapy: Long-Term Follow-Up With IVUS (14 patients, 28 ruptured plaques)



***Conclusions*—Nearly 2 years of follow-up found that spontaneous coronary atheromatous plaque rupture without significant stenosis detected on first acute coronary syndrome healed without significant plaque modification in 50% of cases with medical therapy. (Rioufol G, et al. *Circulation*. 2004;110:2875-2880.)**

Angioscopic follow-up study of coronary ruptured plaques in nonculprit lesions.



Pinkish-white thrombus on the yellow plaque

Smooth white intima without thrombus

The mean follow-up period was 13±9 months.

The healing rate increased according to the follow-up period (23% at ≤12 months vs. 55% at >12 months, p= 0.044). The %DS at the healed plaque increased from baseline to follow-up (12.3% to 22.7%, p<0.05).

The serum CRP level in patients with healed plaques was lower than that in those without healed plaques (p= 0.007).

Takano M et al, *J Am Coll Cardiol* 2005;45:652– 8

Cardiovascular events in patients with coronary plaque rupture and nonsignificant stenosis.

Seventeen consecutive patients with plaque rupture

Mean follow-up duration: 43 ± 25 months,

Events related to those lesions were

1 death (6%) of undetermined cause (6%) after 69 months, no myocardial infarction, and

2 revascularizations (12%) at 3 and 67 months.

Overall, the cumulative rate of cardiac events was 18%.

Ohlmann P, et al, *Am J Cardiol* 2005;96: 1631-1635

Comparison of three recent studies

	Rioufol et al	Angioscopy	WHC data

Background

Because culprit/target lesions with ruptured plaque morphologies typically have significant lumen compromise, there is little hesitation to treat with percutaneous revascularization.

However, secondary, *non-culprit/non-target lesions* with plaque ruptures are usually not stenotic; and the best treatment (i.e. revascularization vs. medical therapy) is controversial, in part because of a lack of natural history data.

Purpose

Using serial IVUS, to evaluate the natural evolution of secondary (non-culprit/non-target lesion) ruptured plaques and assessed the impact of statin therapy on the morphologic changes.

Study Population

- **We identified 28 patients from AMC clinical and IVUS core laboratory database with non-target/non-culprit lesions and without significant stenosis which underwent baseline and 1-year follow-up IVUS study.**

- **Statin treatment (n=14, 20mg atorvastatin in 7 patients and 40mg simvastatin in 7 patients) vs. non-statin treated group (n=14).**

Anti-platelet regimen

Aspirin, indefinitely and

Ticlopidine for 1 month in 9 patients or
Clopidogrel

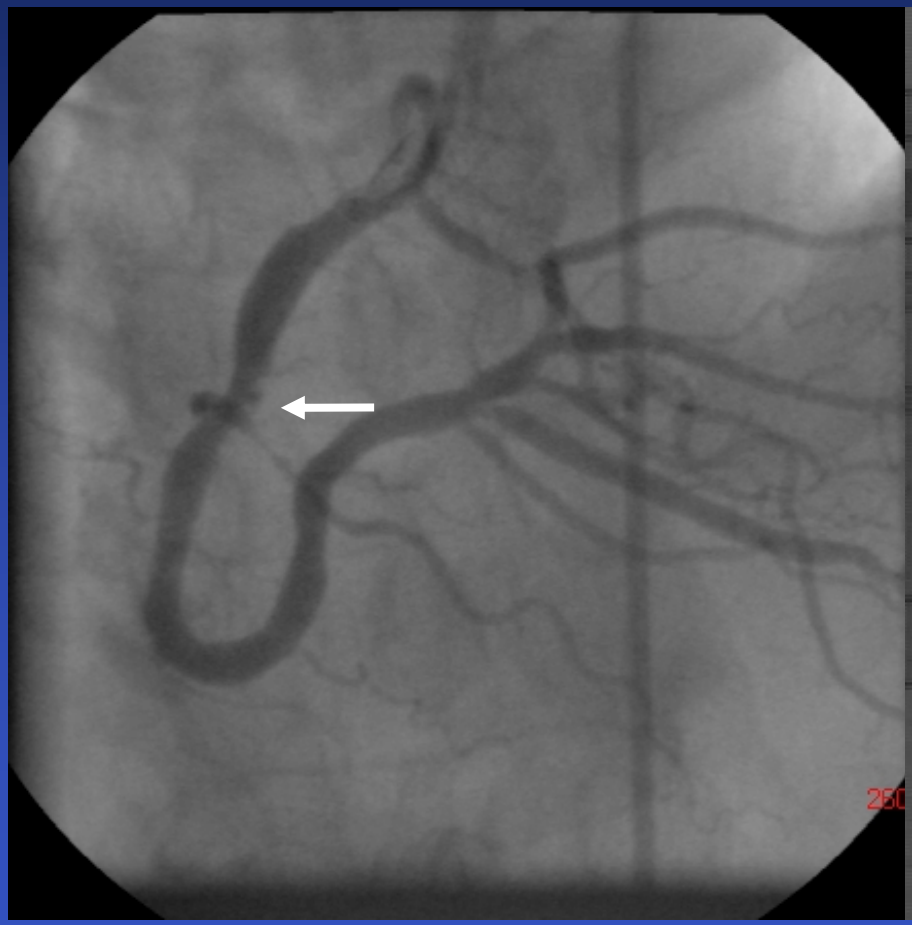
for 1 month in 17 patients after BMS implantation,
for 6 months in 2 patients after DES implantation

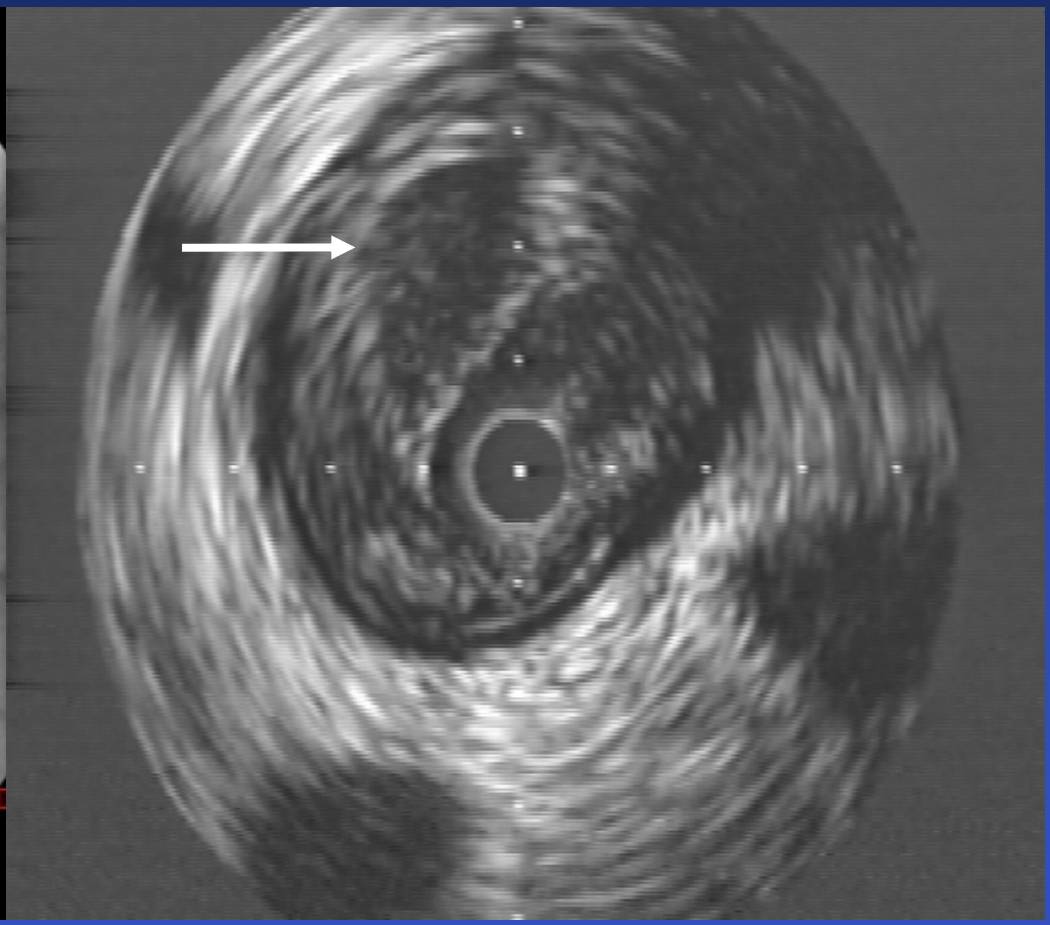
IVUS Imaging Protocol

- **Pre-intervention and 1-year follow-up IVUS**
- **Use of motorized transducer pullback (0.5 mm/sec, pullback speed multiplied by number of seconds).**
- **After intracoronary administration of 0.2mg NTG**
- **From the distal coronary artery to aorto-ostial junction**
- **CVIS system: 1,800 rpm, 3.2F IVUS catheter**

Definition of Plaque Rupture

A plaque with cavity that communicated with the lumen with an overlying residual fibrous cap fragment





Definition of Plaque Rupture Healing

Complete plaque rupture healing:

1) the disappearance of the intraplaque cavity,
2) complete continuation of the intimal layer, and
3) no reduction of lumen CSA.

Incomplete healing:

>50% decrease in plaque cavity CSA without a reduction of lumen CSA.

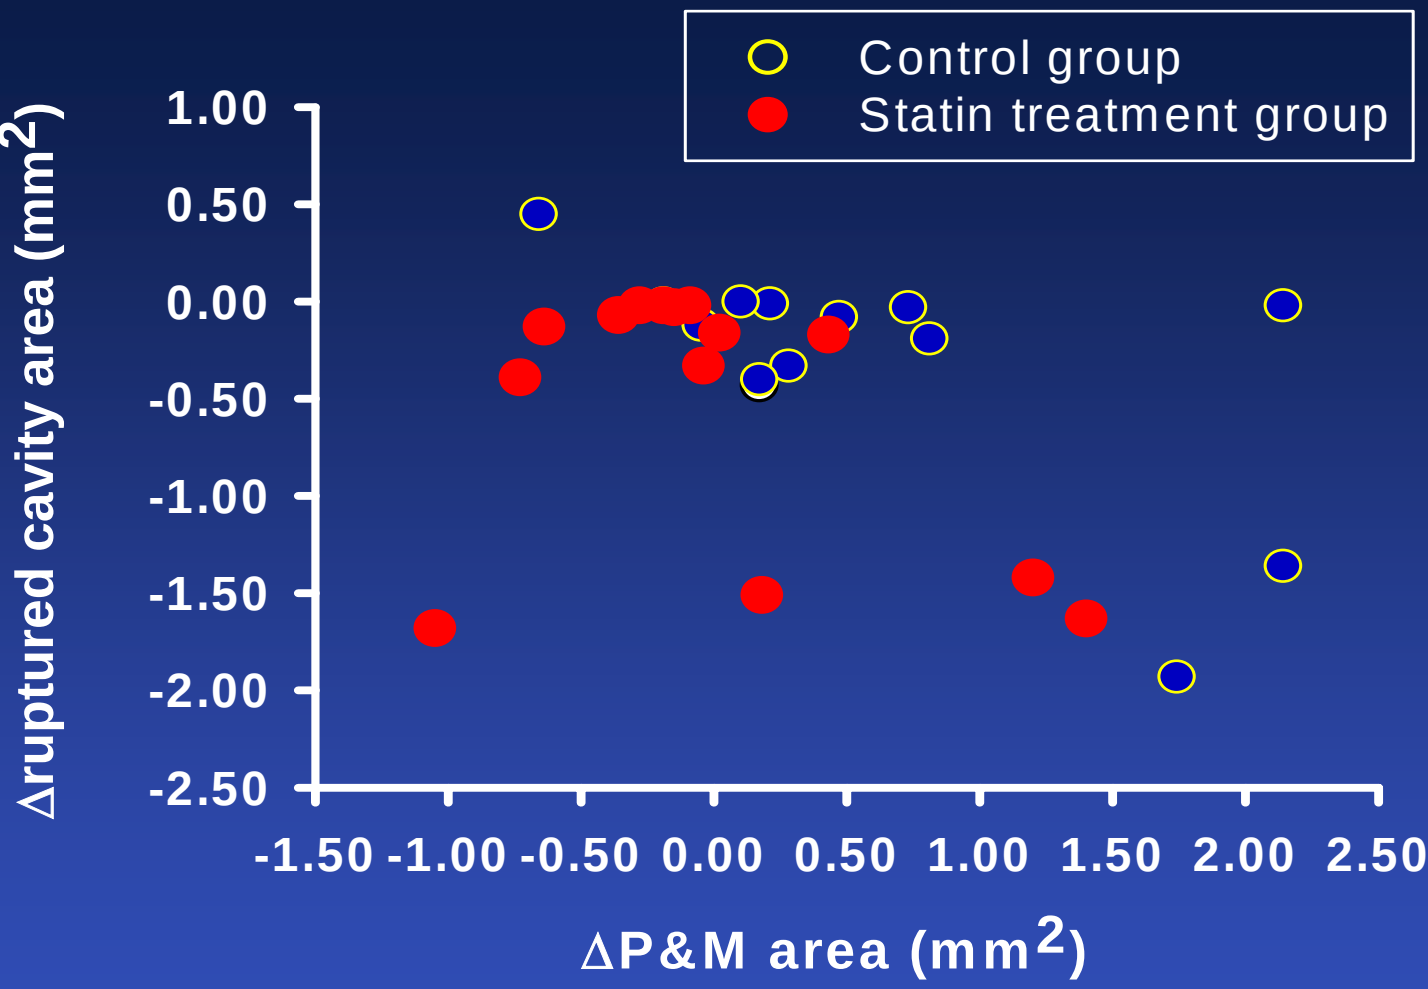
Predictors of healing.

- **Using △ruptured cavity CSA as a continuous measure of plaque rupture healing**

- **The only independent predictor of △ruptured cavity CSA was △P&M CSA:**
overall (r=0.412, p=0.029, 95% CI= -0.614 to -0.035);

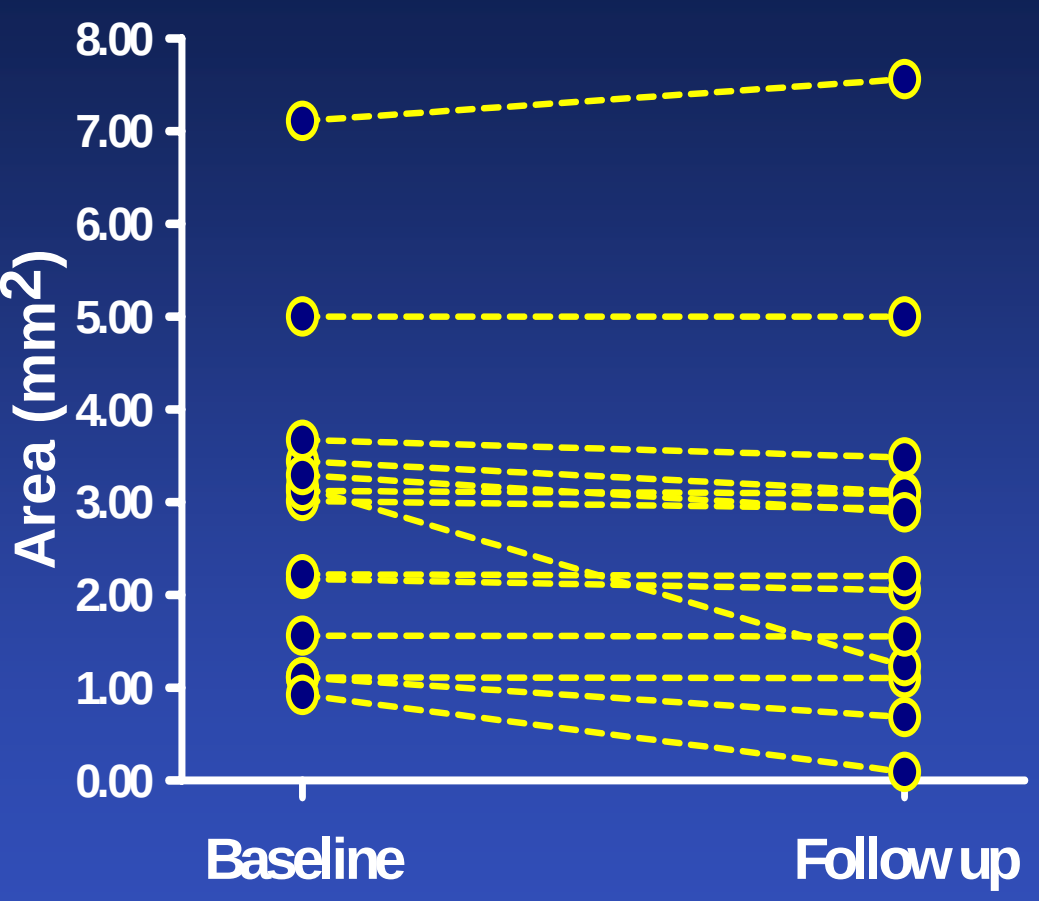
in statin-treated patients (r=0.387, p=0.172, 95% CI= -0.973 to 0.194); and in non-statin treated patients (r=0.646, p=0.017, 95% CI= -0.821 to -0.100).

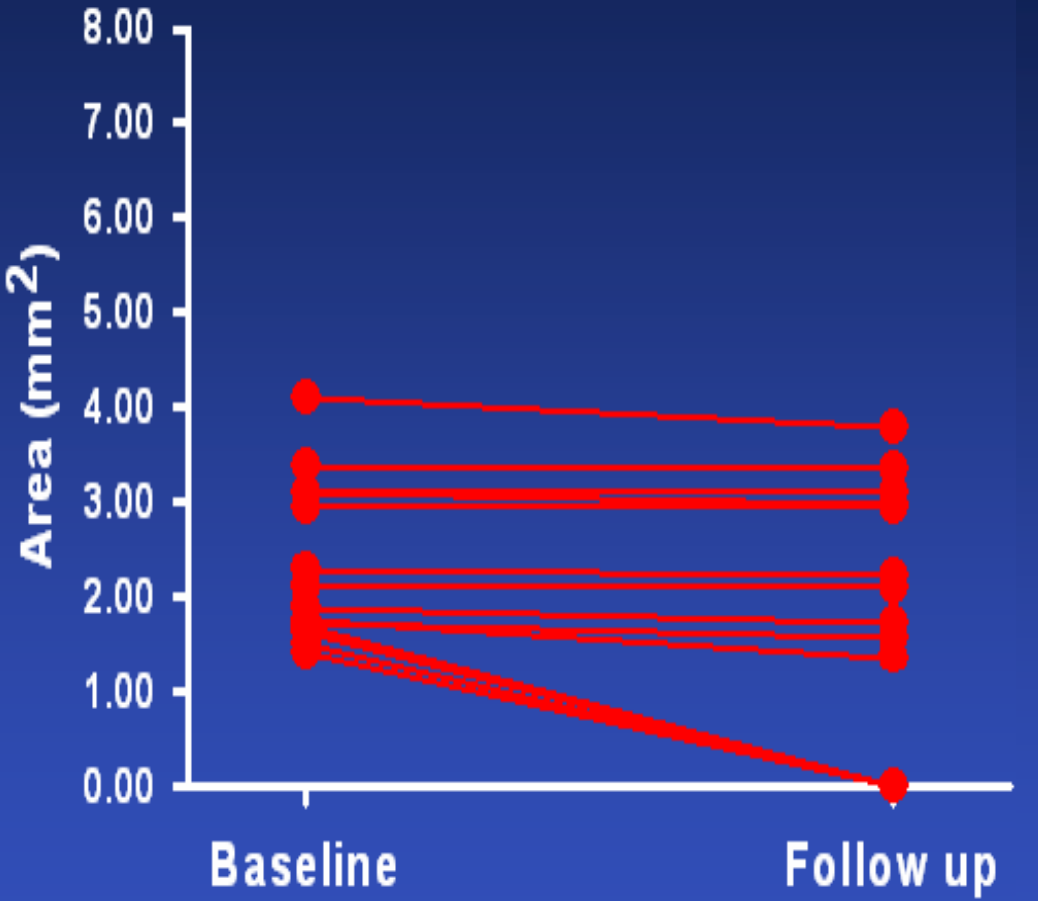


in statin-treated patients; r=0.387, p=0.172

in non-statin treated patients; r=0.646, p=0.017.

Changes of ruptured plaque area





Control group
Statin treatment group

Conclusion

- **The current 12-month follow-up IVUS study showed beneficial effects of statin treatment on reduction of revascularization rates and stabilization of non-culprit/non-target lesion plaque ruptures without significant stenosis.**

- **Conversely, healing of non-statin-treated non-culprit/non-target lesion plaque ruptures can be responsible for lesion progression requiring revascularization.**

Next step – – →
To identify vulnerable plaque before it rupture and to start statin therapy

Comparison of Virtual Histology to Intravascular Ultrasound of Culprit Coronary Lesions in Acute Coronary Syndrome and Target Coronary Lesions in Stable Angina Pectoris

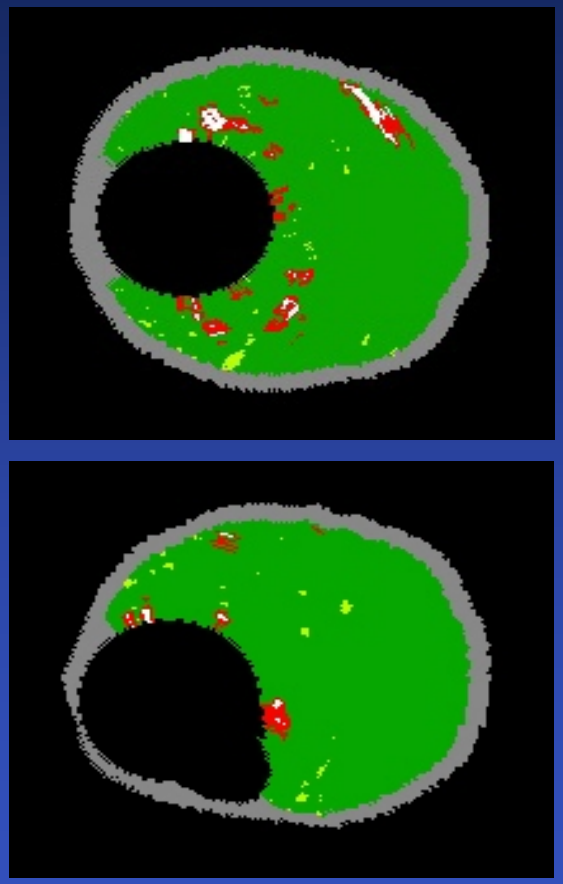
VH Study in AMC

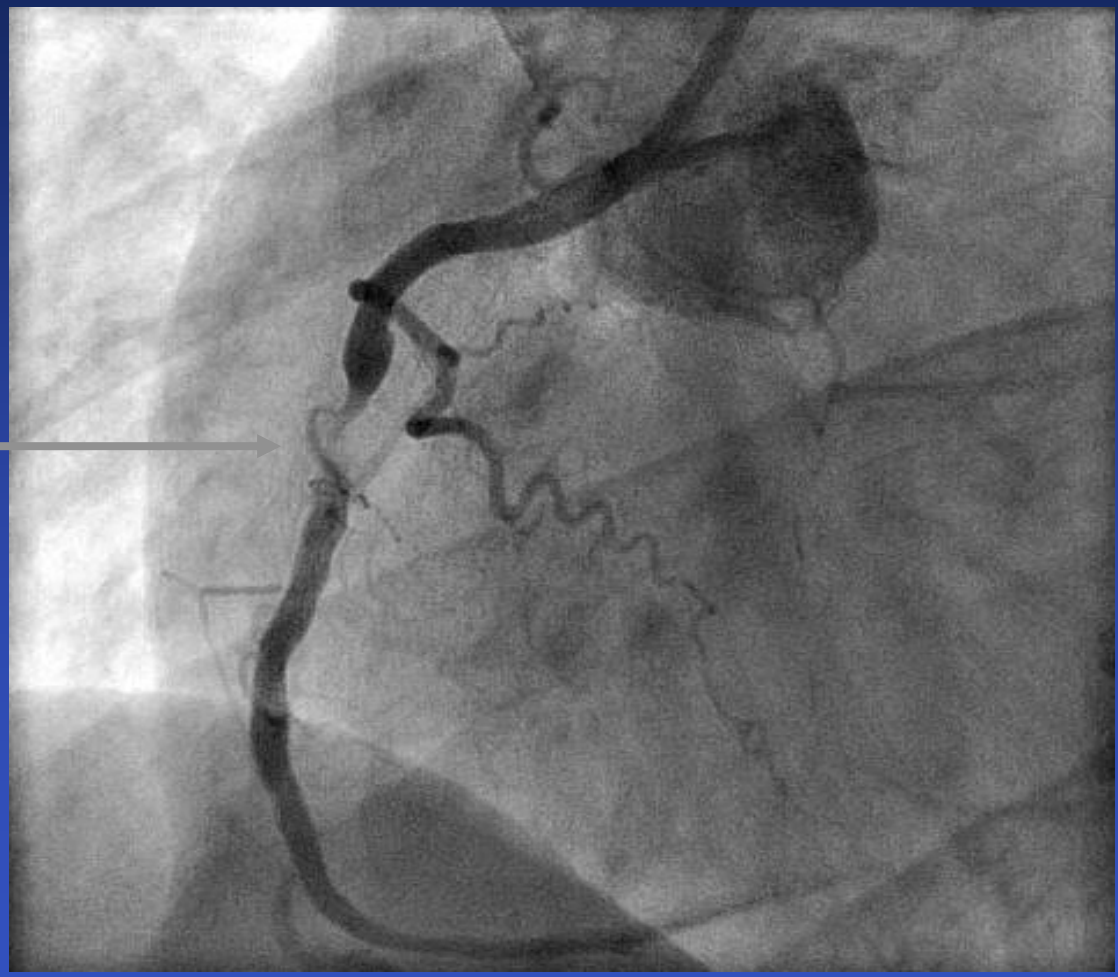
Plaque Composition of Target/ Culprit Lesions in Stable vs. ACS

- **Three hundred eighteen patients who underwent VH-IVUS in the target/culprit lesions from May 2005 to July 2006.**

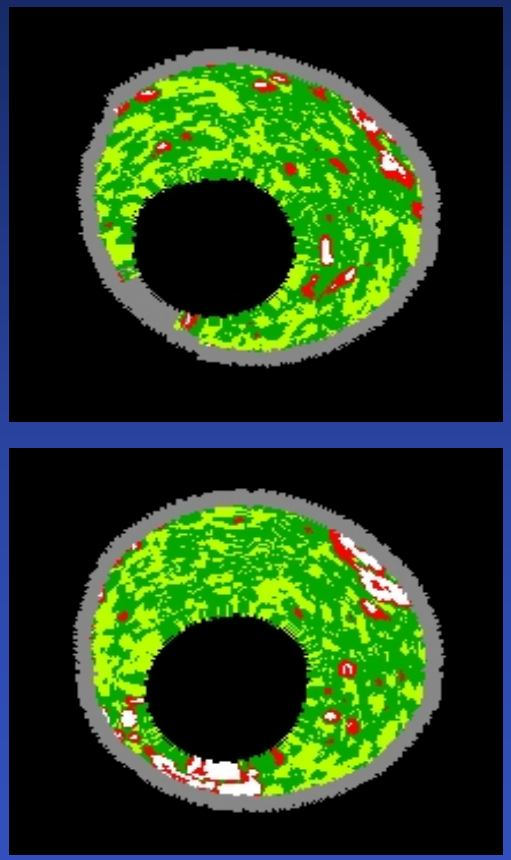
- **Three hundred eighteen patients composed of 195 SAP patients and 123 ACS patients.**

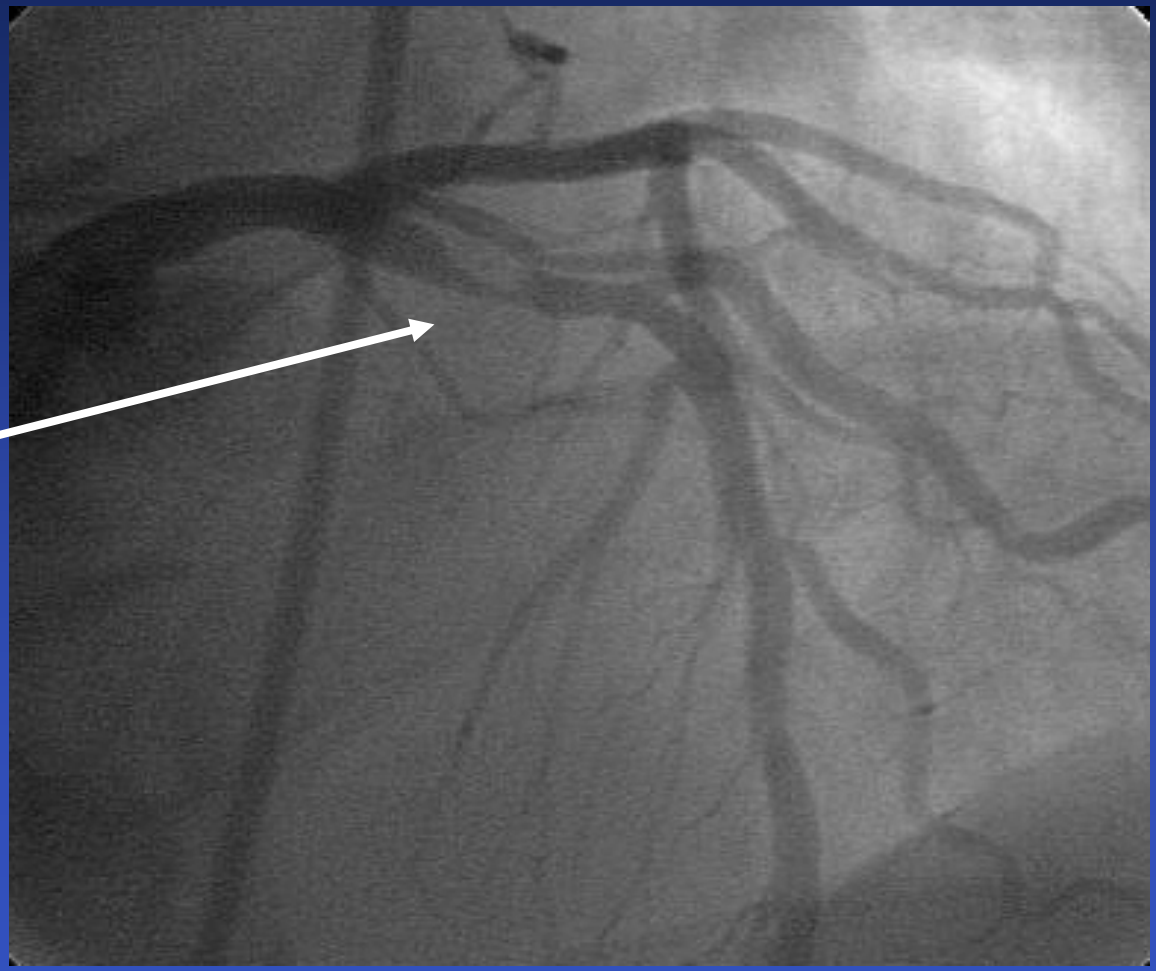
Fibrotic Plaque



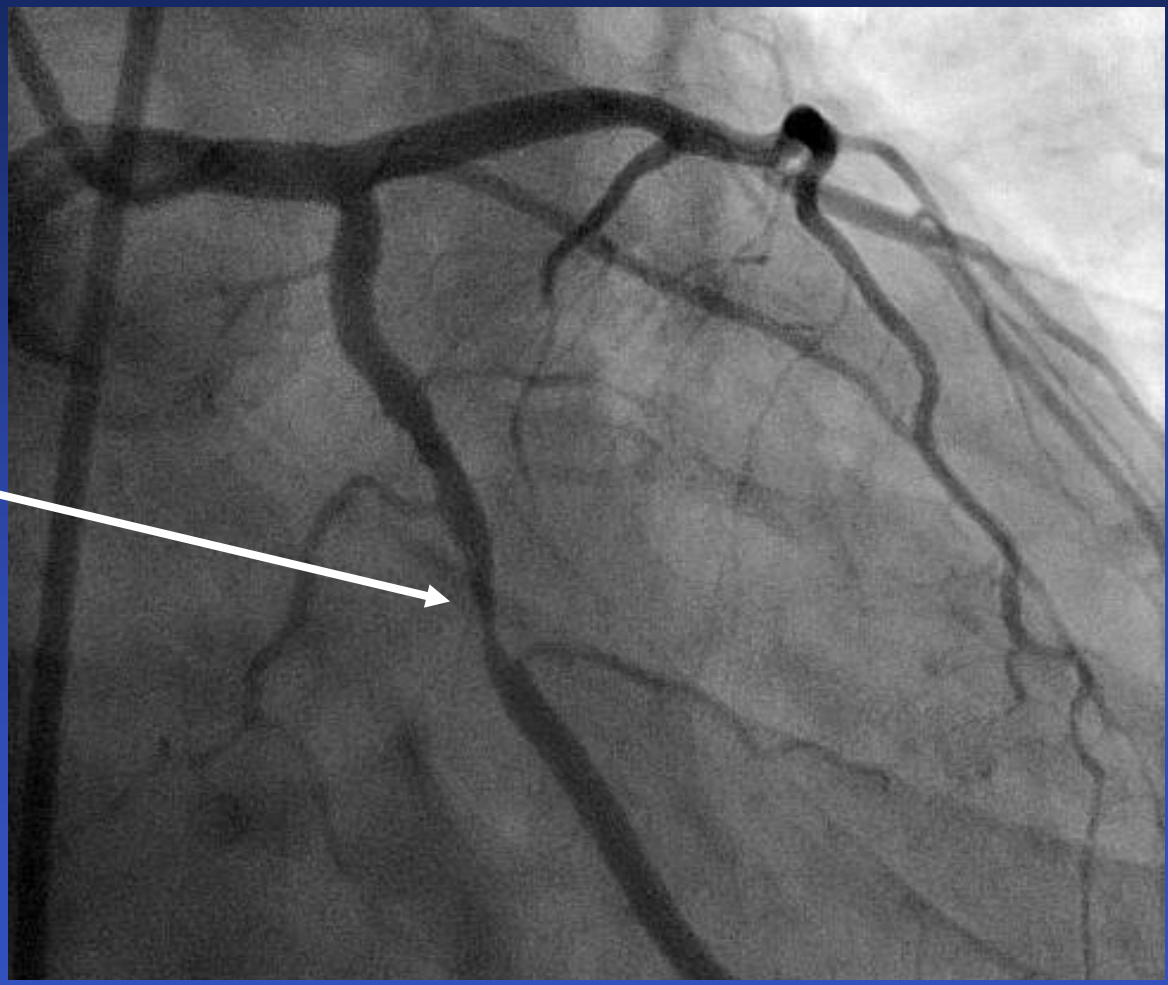


Fibrofatty Plaque

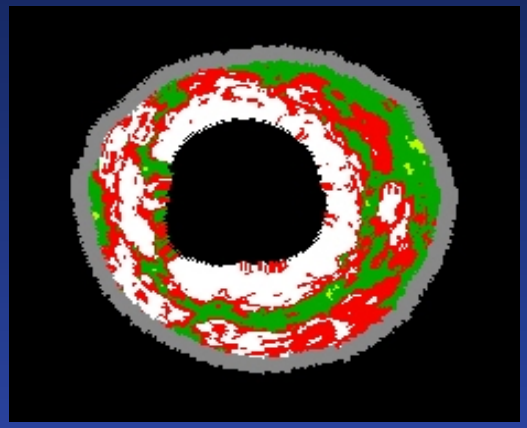


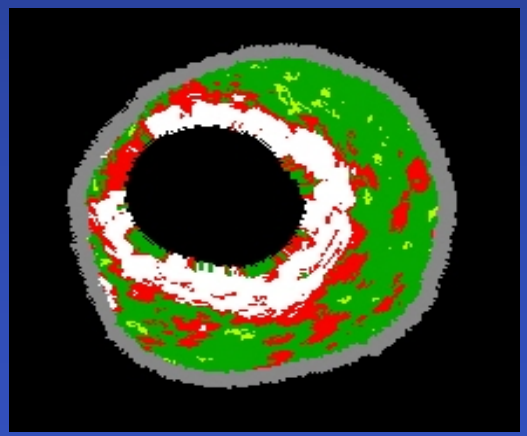


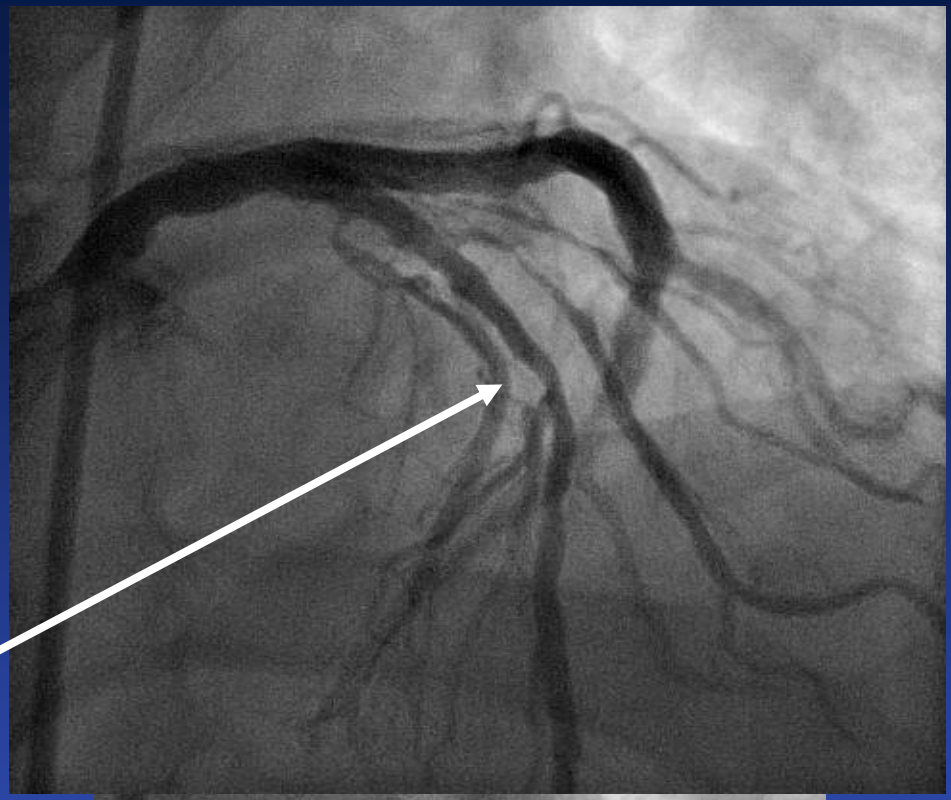
Necrotic Core

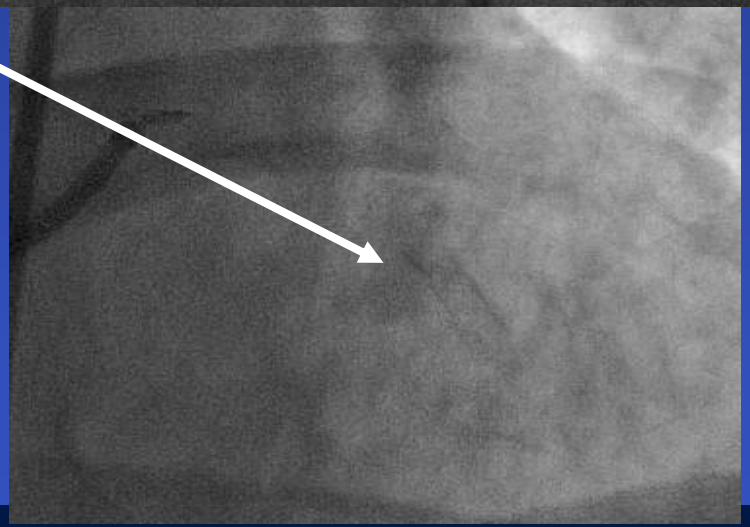


Dense Calcium





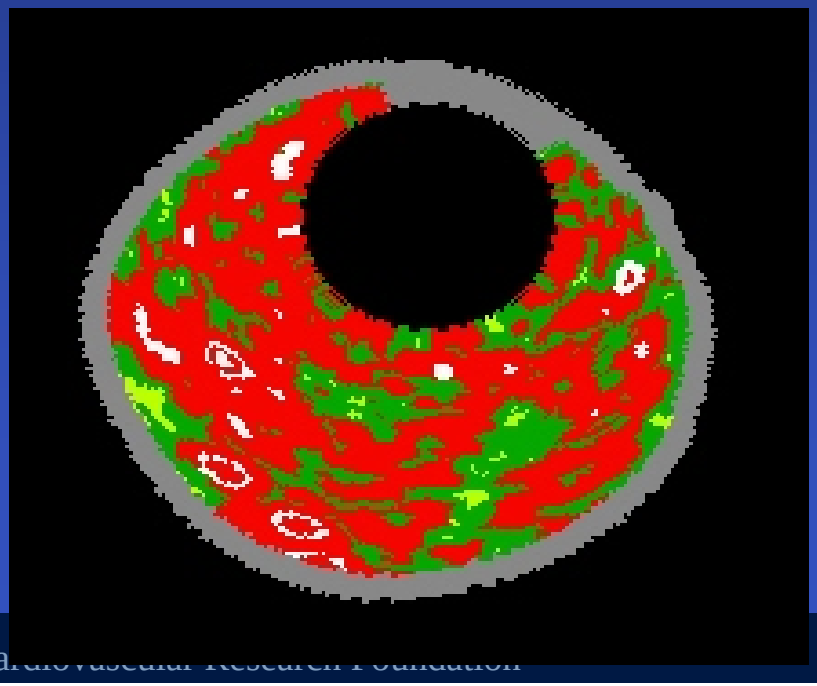




Thin-Cap FibroAtheroma (TCFA) by VH-IVUS

- In at least three consecutive frames:
- 1) necrotic core ≥ 10% without evident overlying fibrous tissue and
- 2) percent atheroma area ≥ 40%.

(Rodriguez-Granillo GA et al. *J Am Coll Cardiol* 2005;46:2038–42)



IVUS Measurements

Planar VH-IVUS measurements were performed at 2 lesion segments (minimum lumen cross-sectional area and the largest of necrotic core) and volumetric analysis.
