

Invasive Diagnostic

Ik-Kyung Jang, MD, PhD

Associate Professor of Medicine
Harvard Medical School

Massachusetts General Hospital

Angioplasty Summit 2008

Stable vs Vulnerable Plaque

Stable Plaque

- Low lipid conc.
- Thick fibrous cap
- Low m ϕ density

Vulnerable Plaque

- High lipid conc.
- Thin fibrous cap
- High m ϕ density

Current Technology for VP Identification

Non invasive

- CTA
- MR

Invasive

- Anatomic
- Physiologic

Intravascular Modalities

- IVUS
- Angioscopy
- IV MR
- OCT

Anatomic Information

IVUS

- Echolucency

- Remodeling

- Distensibility

IVUS

- Echolucency

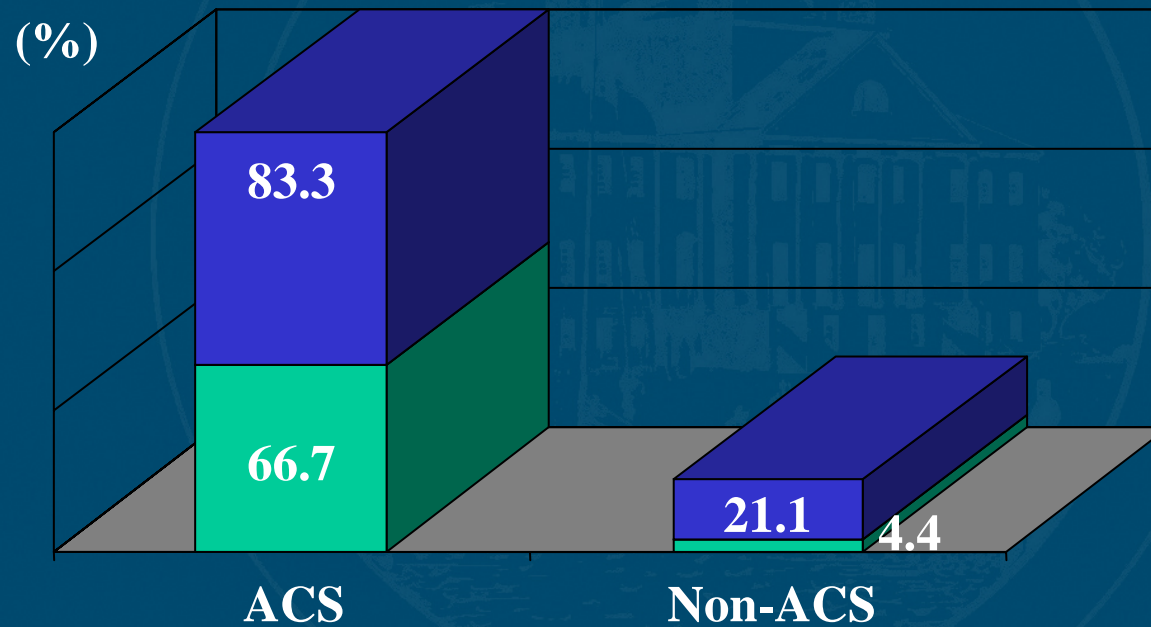

- Remodeling

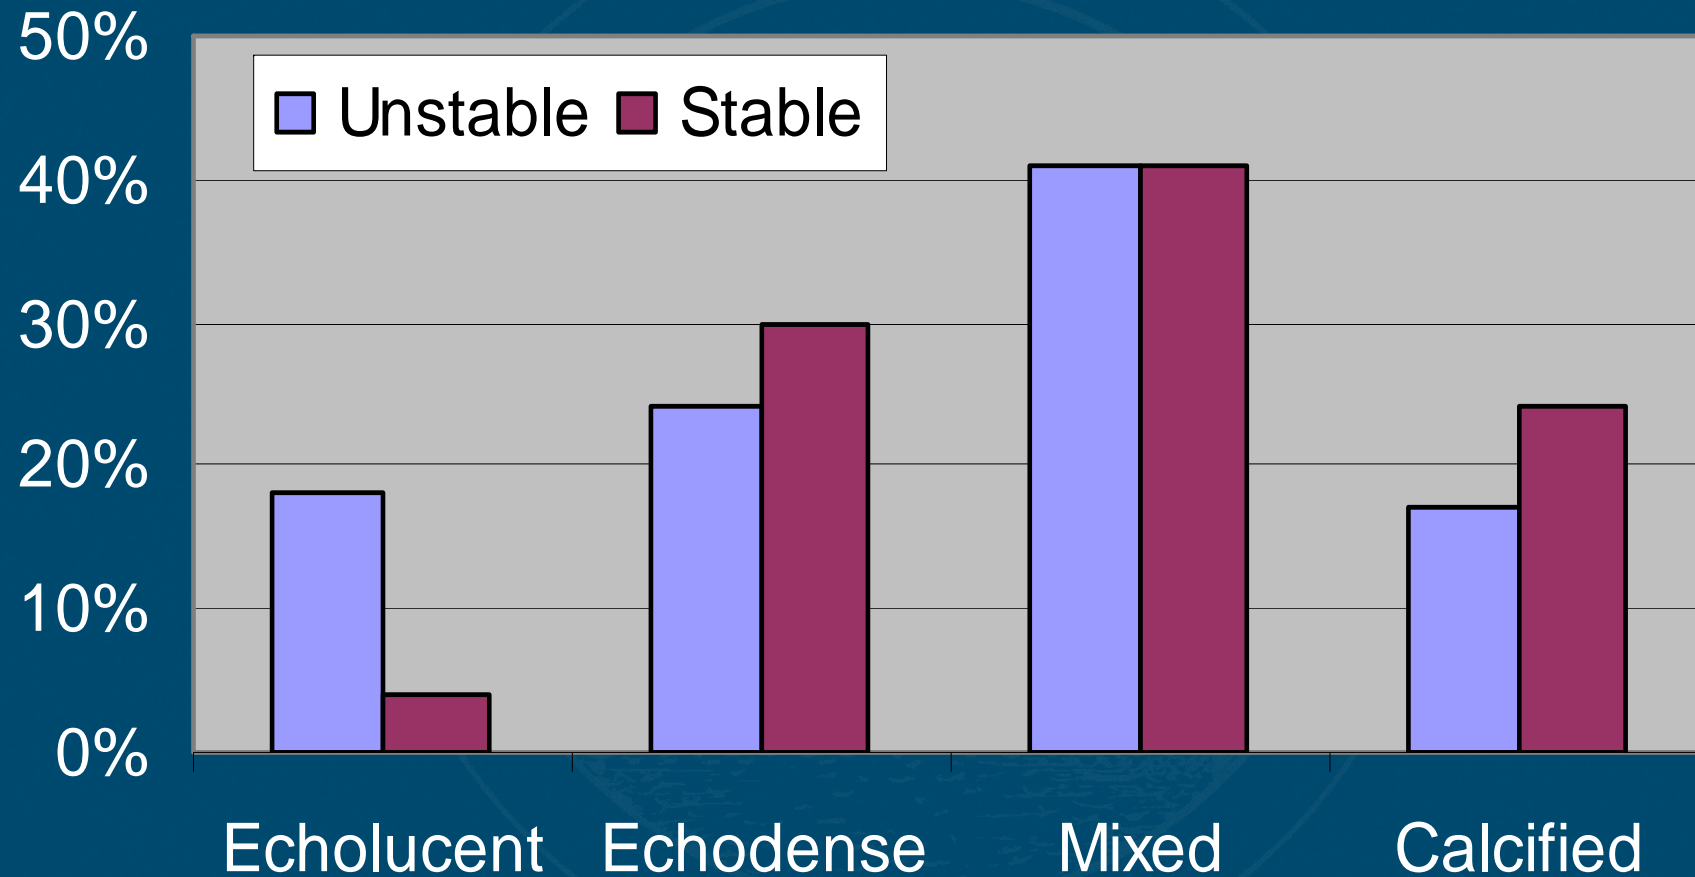

- Distensibility

Prevalence of Echolucent Area on IVUS

Echolucent Area: Unstable vs stable angina

Schoenhagen et al. Circulation 2000

Echolucenty

- Previous histological studies have demonstrated that the discrimination of lipid is inconsistent using greyscale images alone.
 - Palmer *et al.* Eur Heart J., 1999
 - Peters *et al.* J Am Soc Echocardiogr., 1994
 - Peters *et al.* Circulation, 1994

IVUS vs OCT (n = 145)

	Sensitivity (%)	Specificity (%)	PPV (%)
Deep lipid	17.9	97.0	95
Superficial lipid	6.3	97.0	88
1 quadrant lipid	22.7	93.9	93
2 quadrant lipid	1.8	100.0	100

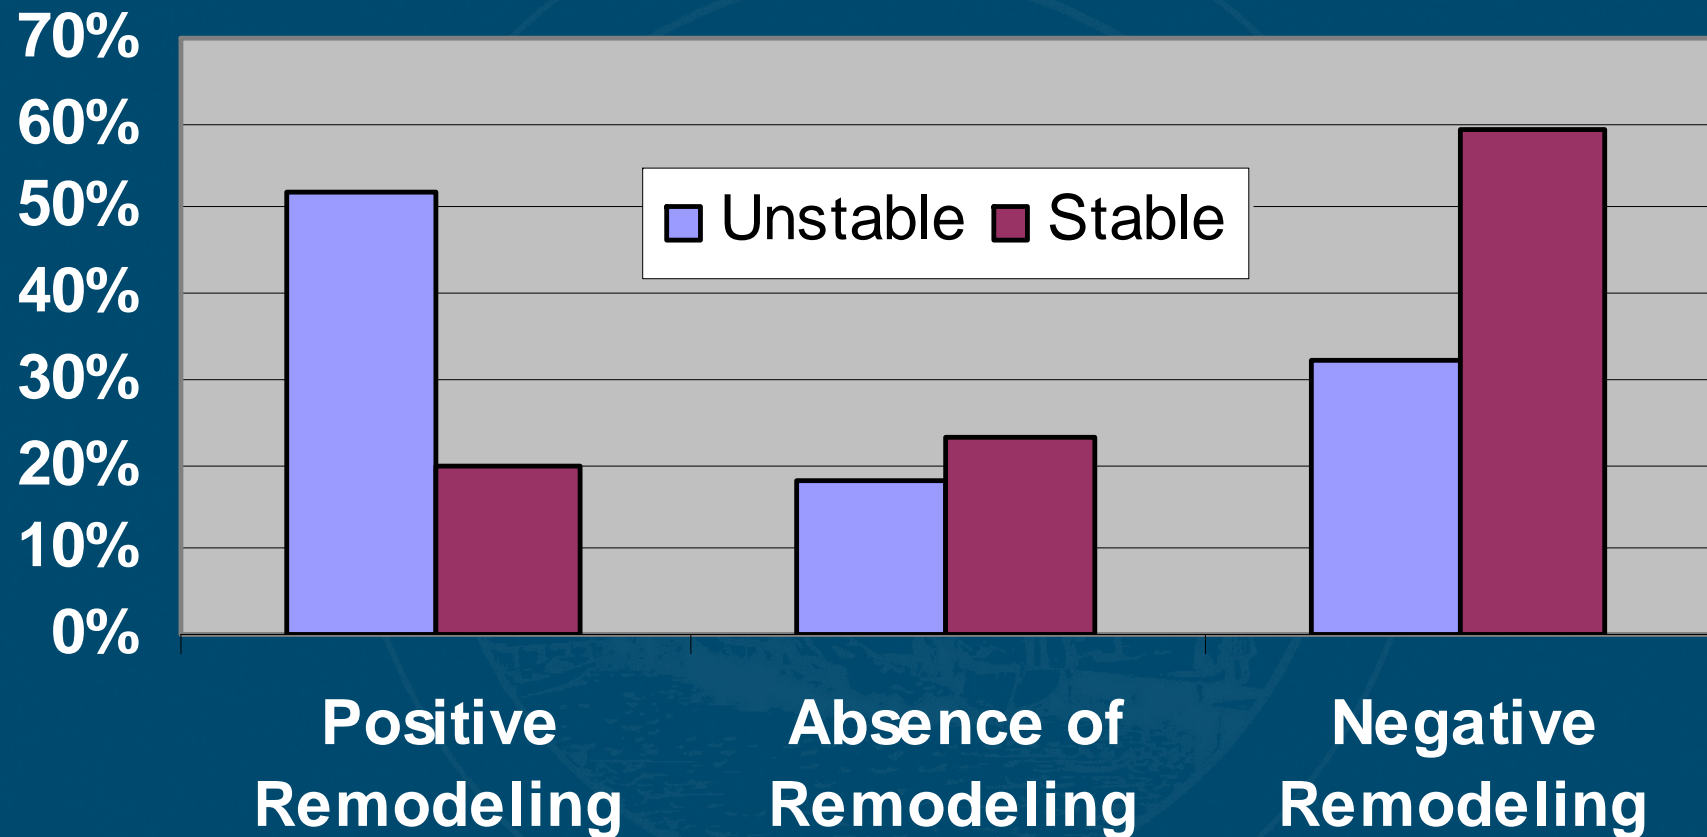

IVUS

- Echolucency
- Remodeling
- Distensibility

Vascular remodeling: Unstable vs stable angina

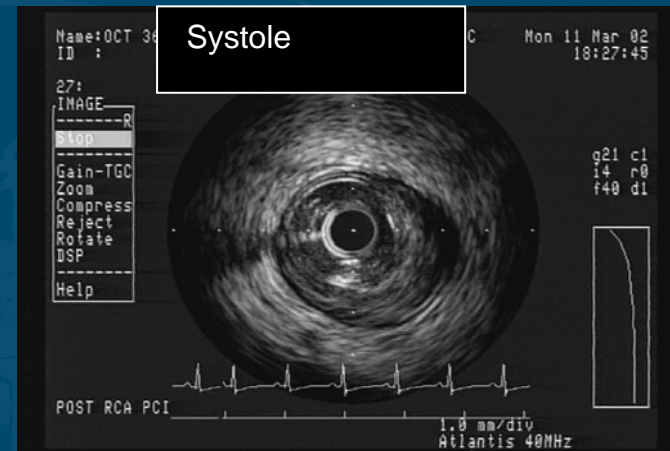

Schoenhagen et al. Circulation 2000

IVUS

- Echolucency
- Remodeling
- Distensibility

Arterial Distensibility Results

	Lipid Rich	Mixed	Fibrous	P
Number	7	6	16	
EEM CSA (mm ²)	16.1 ± 7.2	16.9 ± 4.6	17.1 ± 0.4	NS
Lumen CSA (mm ²)	7.2 ± 1.4	8.5 ± 3.6	8.5 ± 0.4	NS
Plaque Volume (mm ²)	8.9 ± 5.2	8.4 ± 3.5	8.6 ± 2.9	NS
Distensibility Index (mmHg⁻¹)	2.8 ± 1.8	1.7 ± 0.9	1.0 ± 0.8	0.004

- Echolucency → Virtual Histology

- Remodeling (Plaque volume)

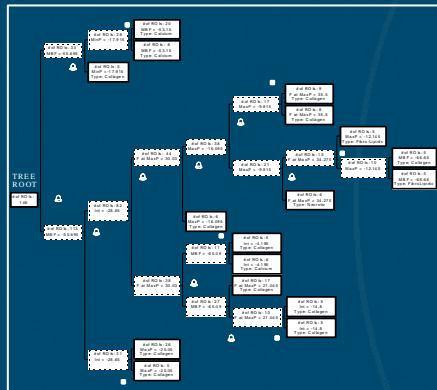

- Distensibility → Palpography

- Angioscopy
- OCT
- IV MR

- Thermography
- Spectroscopy

Near-IR Spectra of Human Aortic Samples

Characterization of plaque histology by NIR spectroscopy (*ex vivo*, *no blood*, *no motion*)

<i>All values in %.</i>			
Sensitivity			
Specificity			
Positive predictive value			
Negative predictive value			

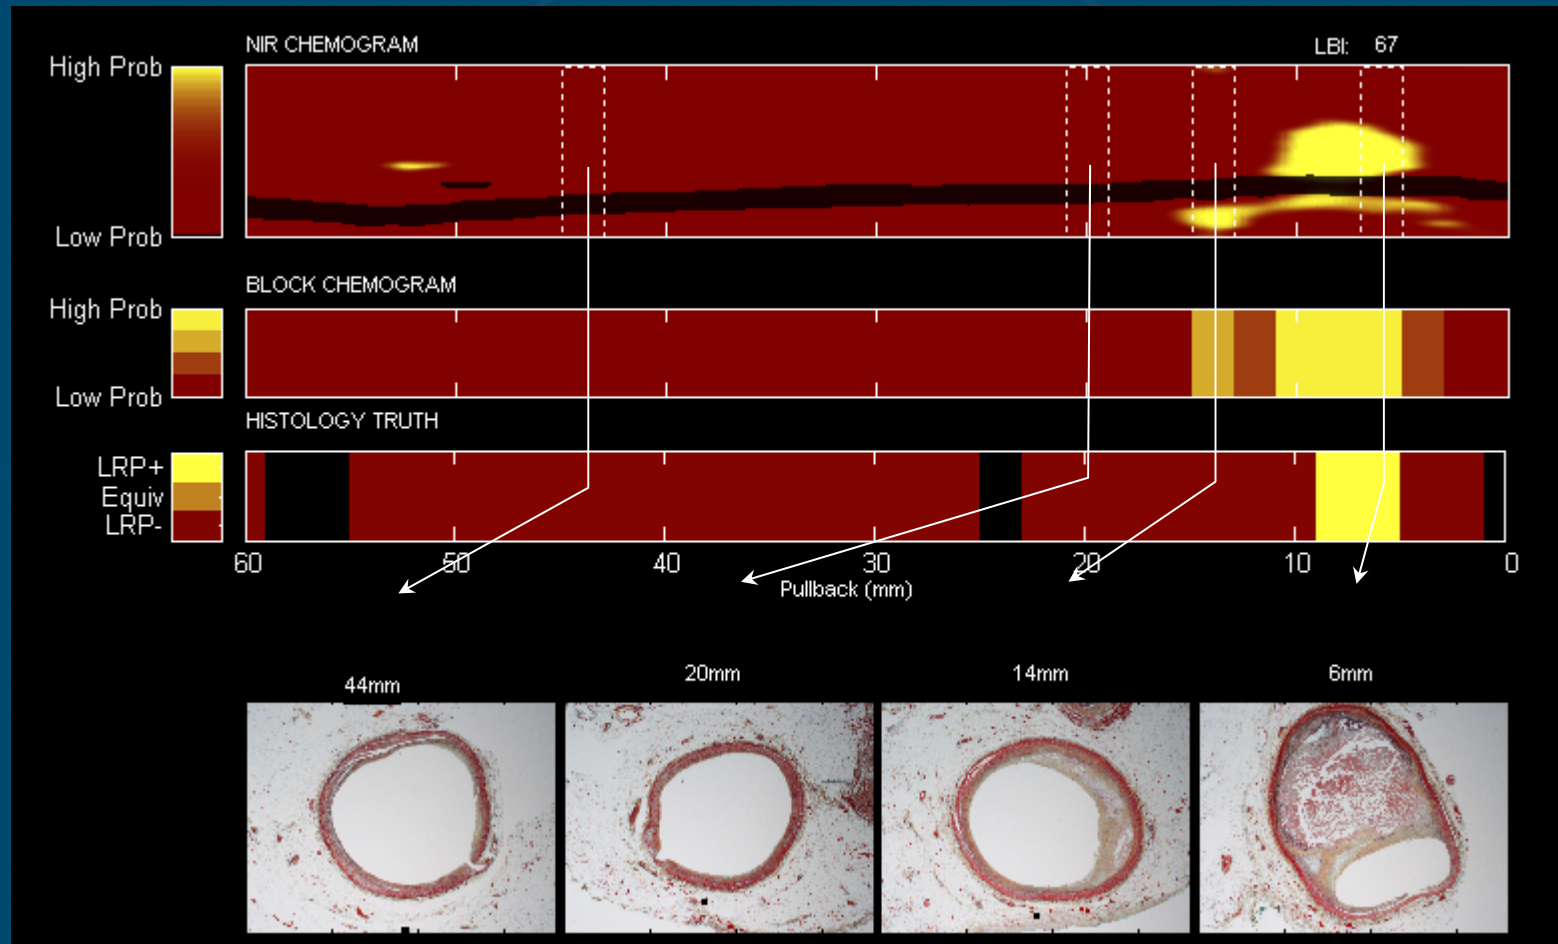

InfraReDx Spectroscopy System

- Three components: console, PBR, catheter (3.2 Fr, monorail, 0.014" compatible)
- Automatically scans artery
- Spectra processed by algorithm and displayed to user as a chemical image of lipid rich plaque probability ("Chemogram")

Comparison of Chemogram with Histology

SPECTACL: No Lipid Signal at Culprit

- 55y, M
- BMI 32.4 kg/m²
- Prog Angina
- +DM, HTN, Chol

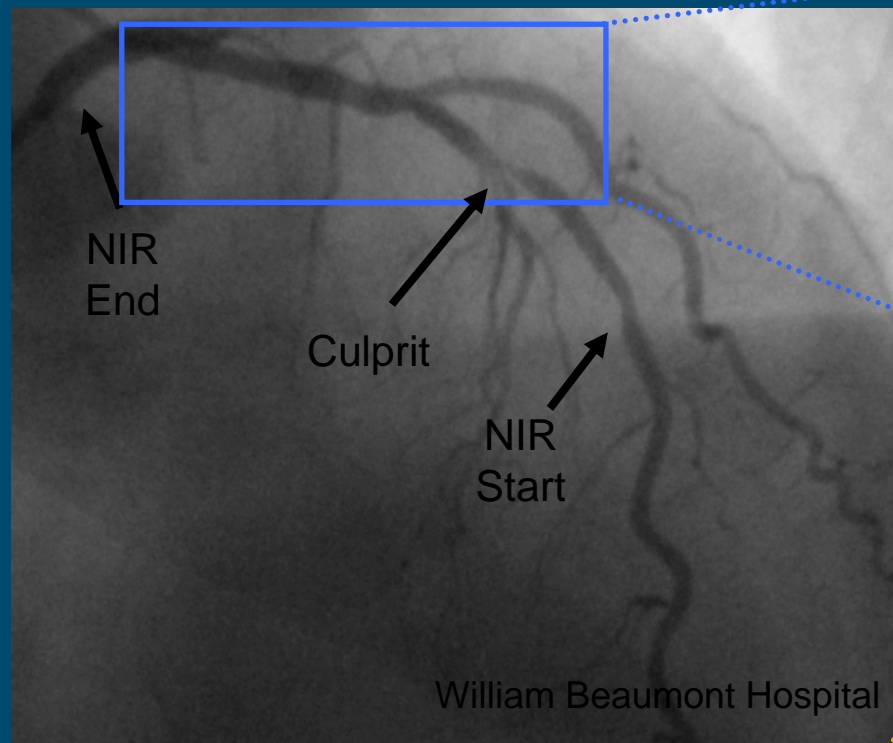

SPECTACL: Lipid Signal at Culprit

- 71y, M
- BMI 28.3 kg/m²
- MI (<72 hrs)
- HTN

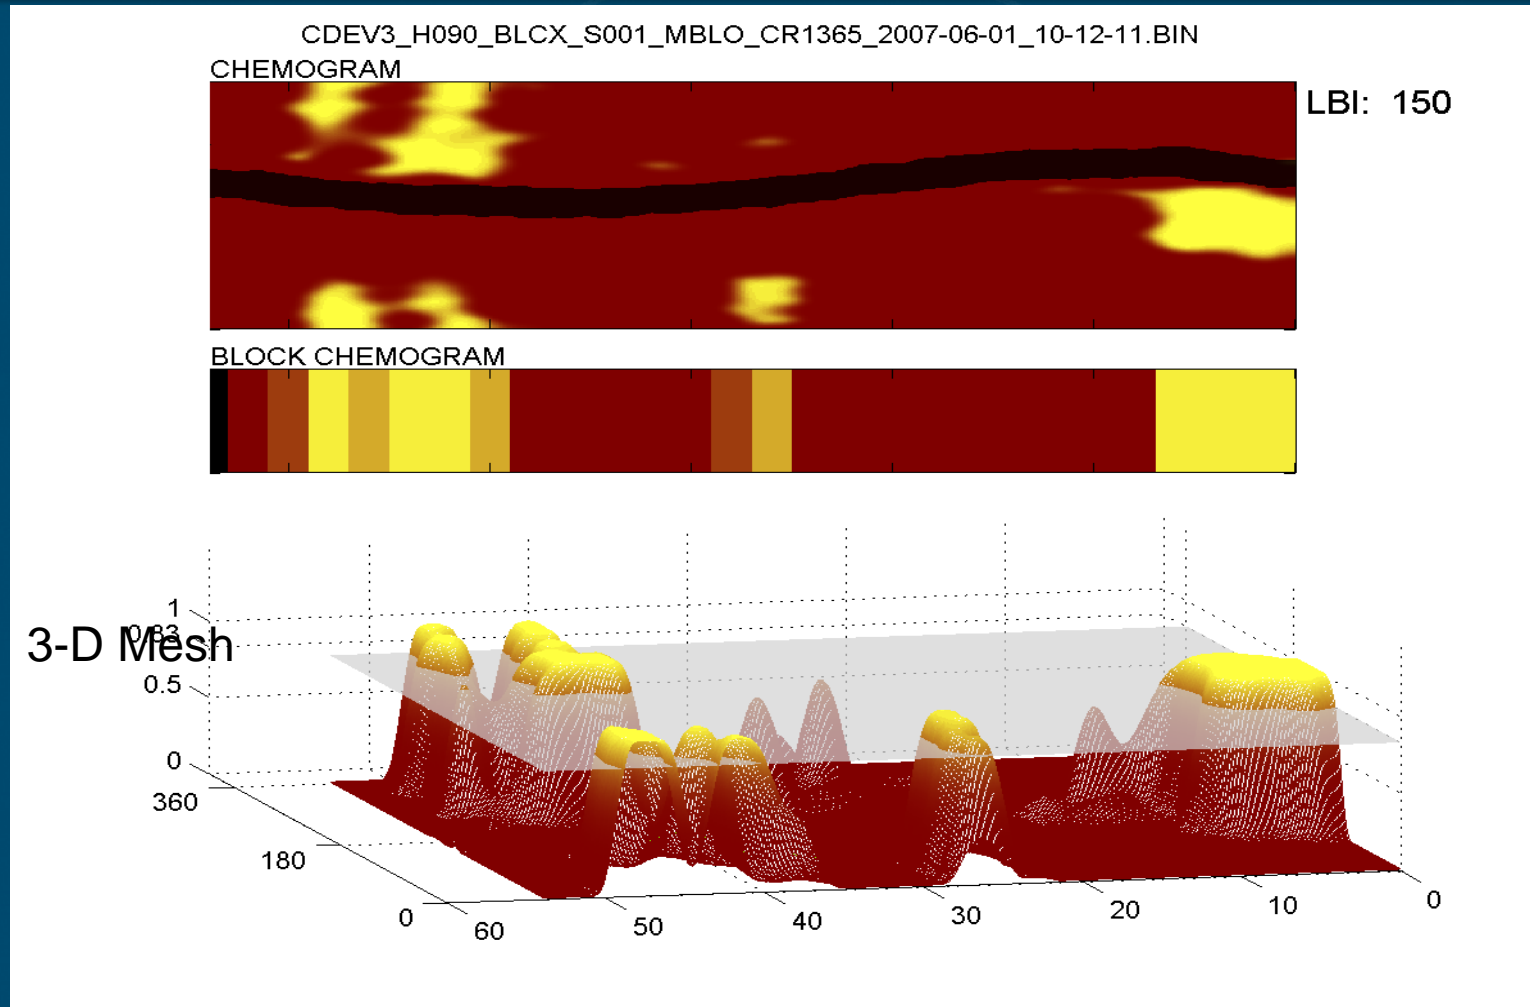

SPECTACL: Other Areas of Interest

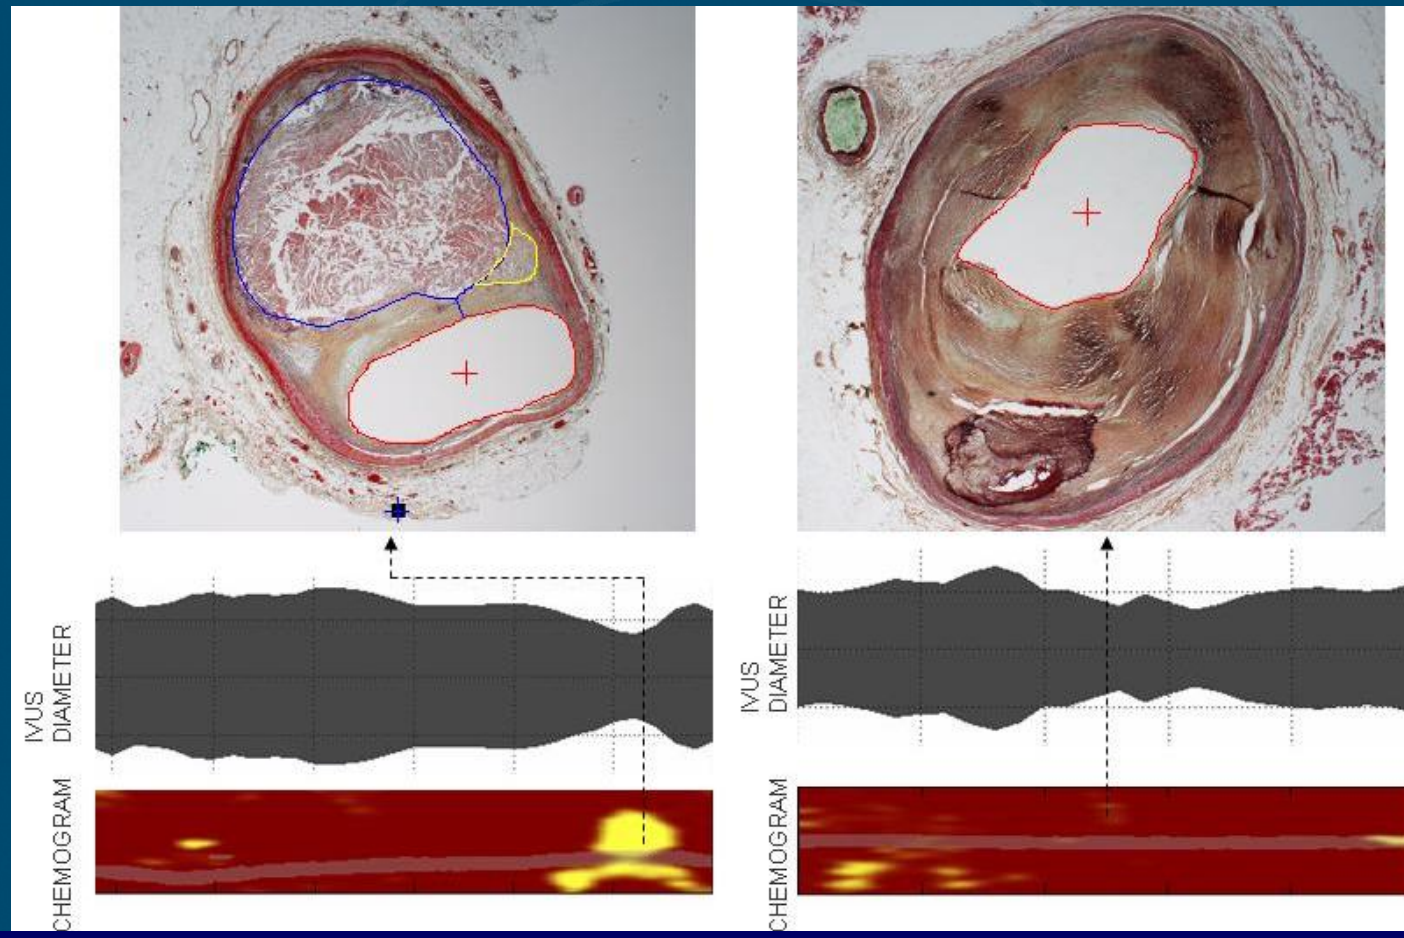

- 59y, F
- Atypical CP
- HTN, Chol, +FH

Multiple views of lipid-rich plaque probability

Intermediate Stenoses Caused by Lipid-rich vs Fibrotic Plaques: Detection by NIR Spectroscopy

“Lipid Burden Index”

- Measure of overall Plaque Burden
 - Potentially useful as measure of risk or of pharmacologic treatment efficacy
- Fraction of Chemogram image pixels above probability of 0.6
 - Scaled from 0 to 1000
- 0.85 AUC vs. fibroatheroma presence (0.79 – 0.91)

LRP Burden Index Mosaic

Invasive Imaging Modalities

- IVUS
- Angioscopy
- IV MR
- **OCT**
- Thermography
- Spectroscopy

Ex Vivo Study Results

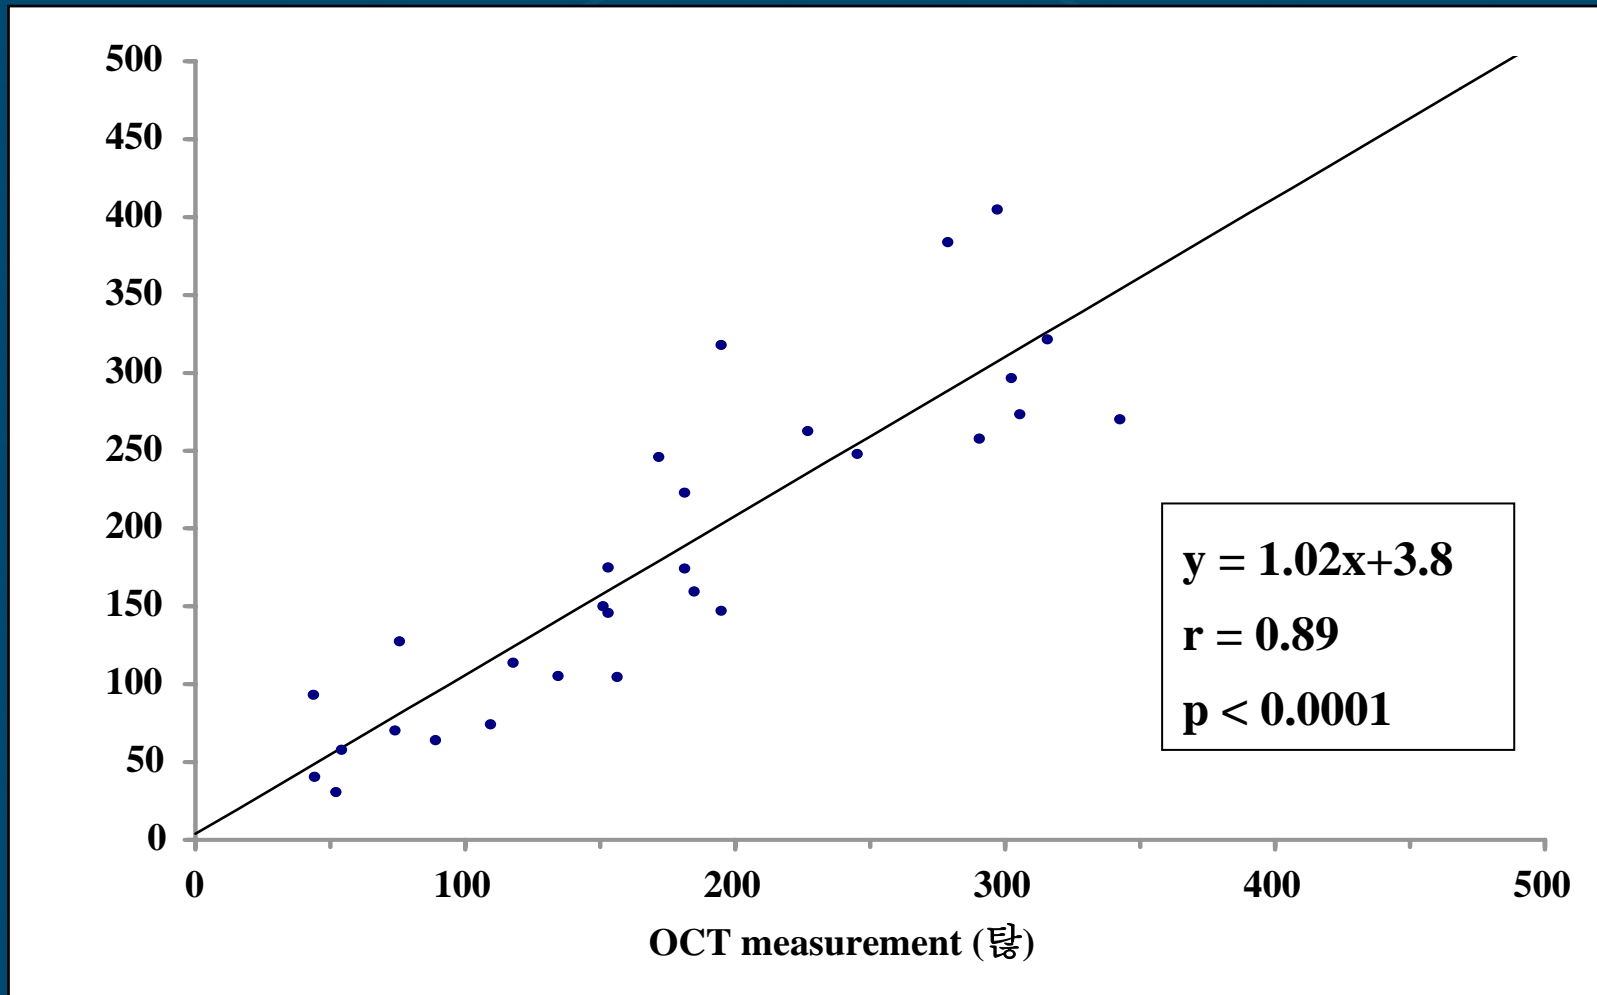

Fibrous	SENS	.87	PPV	.88
	SPEC	.97	NPV	.96
Calcific	SENS	.95	PPV	1.0
	SPEC	1.0	NPV	.95
Lipid pool	SENS	.92	PPV	.81
	SPEC	.94	NPV	.97

Interobserver $k = 0.88$, Intraobserver $k = 0.91$

Correlation between OCT and histology

Linear NSD vs. CD68

CD68 % area > 10 % -
NSD cutoff 6.2%

SENS 100% (70-100%)

SPEC 100% (60 -100%)

Stable vs Vulnerable Plaque

Stable Plaque

- Low lipid conc.
- Thick fibrous cap
- Low m Φ density

Vulnerable Plaque

- High lipid conc.
- Thin fibrous cap
- High m Φ density

Plaque Characterization

- **Goal:** Determine plaque characteristics in various presentations of CAD
- **Methods**
 - Patients with CAD; N=57
 - OCT imaging culprit/remote lesions
 - OCT: 3.0 F catheter 8 cc saline purge
- **Analysis**
 - Clinical presentation:
 - AMI (20)
 - ACS (20)
 - SAP (17)
 - Two OCT readers ⇒ consensus
 - Cap thickness
 - Macrophage density (~NSD)

Cap Thickness

Prevalence of TCFA

Macrophage Density for Acute and Stable Clinical Syndromes

- Cap macrophage density is higher in acute clinical syndromes in both culprit and remote sites

Limitations of OCT

- 1. Need to create blood free zone**
- 2. No scanning capability**
- 3. Shallow penetration depth**
- 4. No functional information**

Intravascular Diagnostics for VP

Modality	Resolution	Penetration	Cap	Lipid	Inflam	Use
IVUS	100 um	good	+	++	-	+++
Angioscopy	-	poor	+	++	-	+
IV MR	160 um	poor	+	++	++	+
OCT	10 um	poor	+++	+++	++	+
Thermography	-	poor	-	-	+++	++
Spectroscopy	-	poor	+	++	++	+

Ideal Invasive Diagnostics for VP

- ❖ **Combination of imaging and physiologic test**
 - **OCT + thermography**
 - **OCT + spectroscopy**
 - **IV MR + thermography**

Invasive Diagnostics for VP

❖ Questions

1. Can one justify the invasive diagnostic tests?
 - invasive
 - high cost
 - pt acceptability as a screening tool
2. Which patients?
3. When to perform the tests?
4. When to treat the lesions??

Optimal Medical Prevention

26.3%
vs.
22.4%
at 2y

Invasive Diagnostics for VP

❖ Inherent limitations

1. Local information (systemic disease)
2. Superficial information
3. Difficulty in sampling the same site
4. Gold standard (??) – validation problem
5. Only when a local therapy is viable!!
