## 41-Year-Old Female Acute Anterior STEMI (MD)

REASON FOR ADMISSION: Chest pain.

HISTORY OF PRESENT ILLNESS: This is a 41-year-old female with multiple cardiac risk factors including diabetes, dyslipidemia, hypertension, and ongoing smoking. She was awakened at 0534 hours with achy chest pain all the way across her chest which was so severe it caused her to sit up and get out of bed. However, she had no nausea, vomiting, or shortness of breath. She went back to bed and managed to get back to sleep. She woke up at 0730 hours. The pain was still there perhaps a bit worse. She communicated to her husband who brought her to the hospital. Unfortunately, they stopped at McDonald's along the way and she had a bacon, sausage, and cheese egg McMuffin on her way to the hospital. The pain resolved somewhat with eating, although she still had chest pain. In the emergency department, she was noted to have ST elevations on her EKG and was started on aspirin, heparin, and metoprolol with essential resolution of her pain to almost zero and perhaps 1/2 to 1 out of 10.

## **Virtual Histology**

### ***Clinical Applications***

- ✧ Good characterization and visualization of plaque composition & volume (plaque burden)
- ✧ Careful border recognition to exclude thrombus
- ✧ Surprisingly widespread distribution of vulnerable plaques in pts with ACS – relating to both culprit and non-culprit arteries

***“Systemic Vascular Illness”***

## Clinical Examples Using Virtual Histology

- ✧ Use of VH may guide use of **aggressive statin therapy**
- ✧ Use of VH to **extend stent length** to cover angiographically silent vulnerable plaque
- ✧ Results of clinical trials pending regarding prophylactic stenting of vulnerable plaque

## What is Virtual Histology?

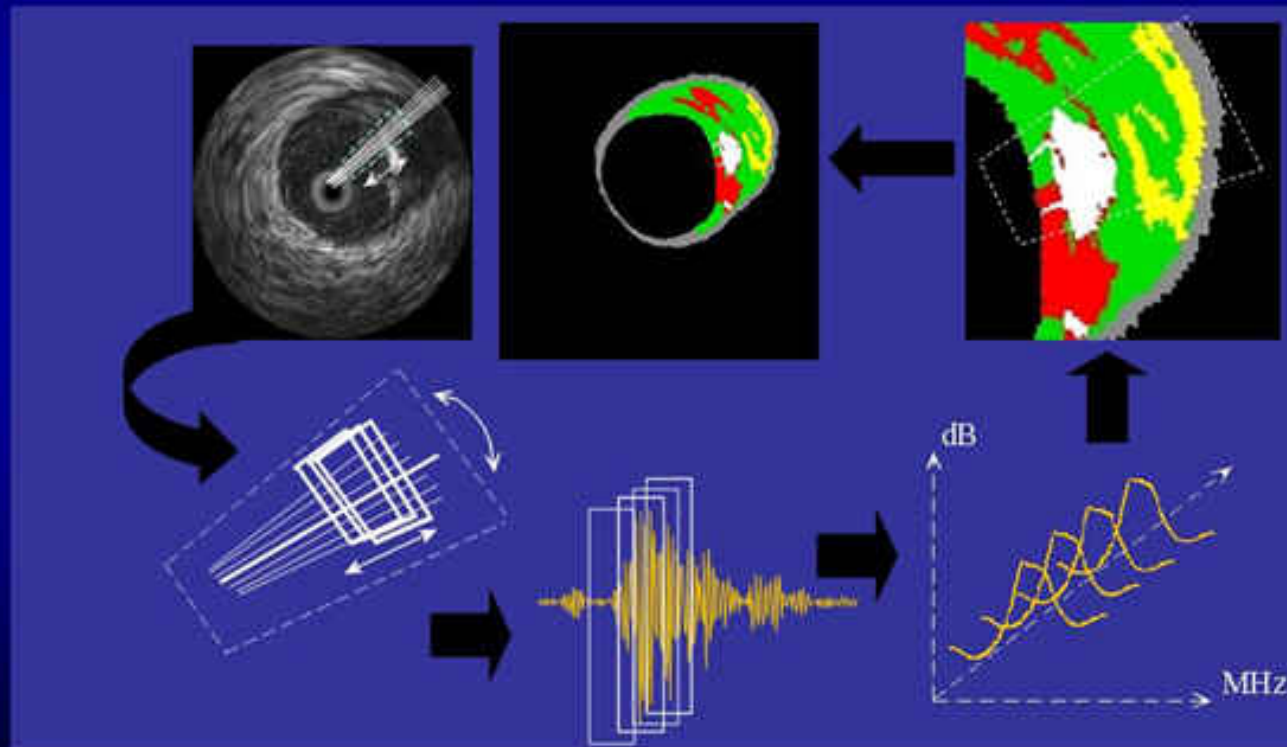

- ✧ Real-time plaque characterization and visualization with spectral analysis of intravascular ultrasound data
- ✧ Spectral analysis of the backscattered radiofrequency ultrasound signals allows detailed assessment of plaque composition

*Anuja Nair, Jon D Klingensmith, D Geoffrey Vince, Cleveland Clinic Foundation*

# Image Interpretation

## The *Volcano IVUS* Program

## Generally Stable Plaque Types\*

**"Fibrous"** – Plaque nearly all fibrous tissue.

**"Fibro-Calcific"** – Mainly fibrous with some Dense Calcium. Necrotic Core 3-10%

**"Pathological Intimal Thickening"** –Fibro-Fatty and Fibrous tissue, with Necrotic Core 0-3% due to micro-calcifications within the Fibro-Fatty tissue. Possible progression to risky atheroma.

3-vessel imaging post PCI of culprit lesion  
IVUS

## Virtual Histology

F/U: 1 mo, 6 mo, 1 yr, 2 yr, ± 3-5 yr  
(event driven)

Meds recommended:  
Aspirin, Plavix 1yr, Statin

Repeat imaging  
in pts with events

Study Complete = 700 enrolled June 06 (from MAHI = 41)

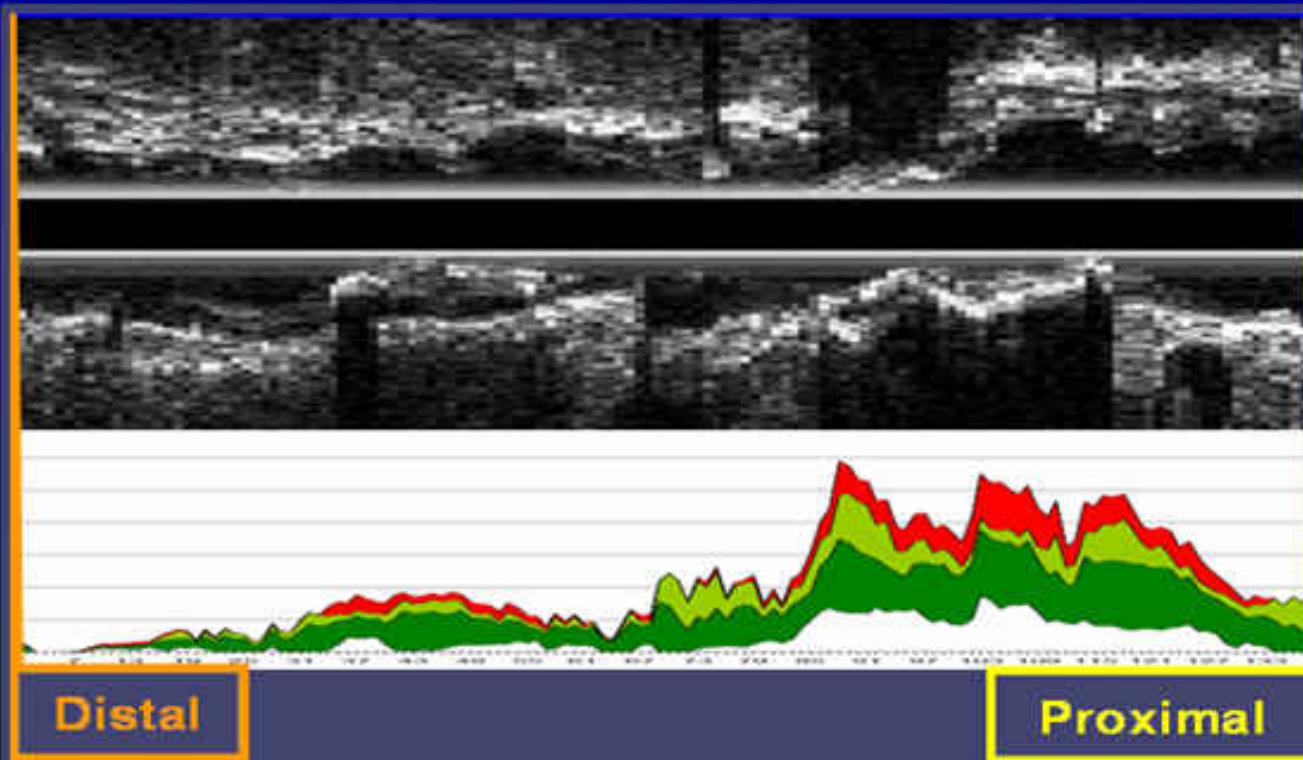

## **IVUS-VH Global Registry Background**

- ✧ **Global, prospective, multi-center, non-randomized, cross sectional IVUS registry**
- ✧ **Time period: 2004-2006**
- ✧ **Global registry**
  - Planned: 3,000 patients
  - Interim analysis: 990 patients
- ✧ **42 centers worldwide**
- ✧ **Materials**
  - IVG3 with VH™ IVUS Software
  - Eagle Eye™ Catheter
  - TrakBack Pullback / R-100 Pullback Devices

# Whole Vessel Analysis

## *Entire Pullback*

The average Cross Sectional Area ( $\text{mm}^2$ ), total volume ( $\text{mm}^3$ ), and % of total volume of different plaque components, plaque burden, and vessel and lumen diameters of the ENTIRE PULLBACK.

## **Study Objective**

**To determine whether plaque composition varies by traditional cardiovascular risk factors**

# Entire Pull Pack Volumetric Plaque Volume: *FRS Strata*

# Age

\* $p < 0.001$ ; † $p < 0.001$  (for trend)

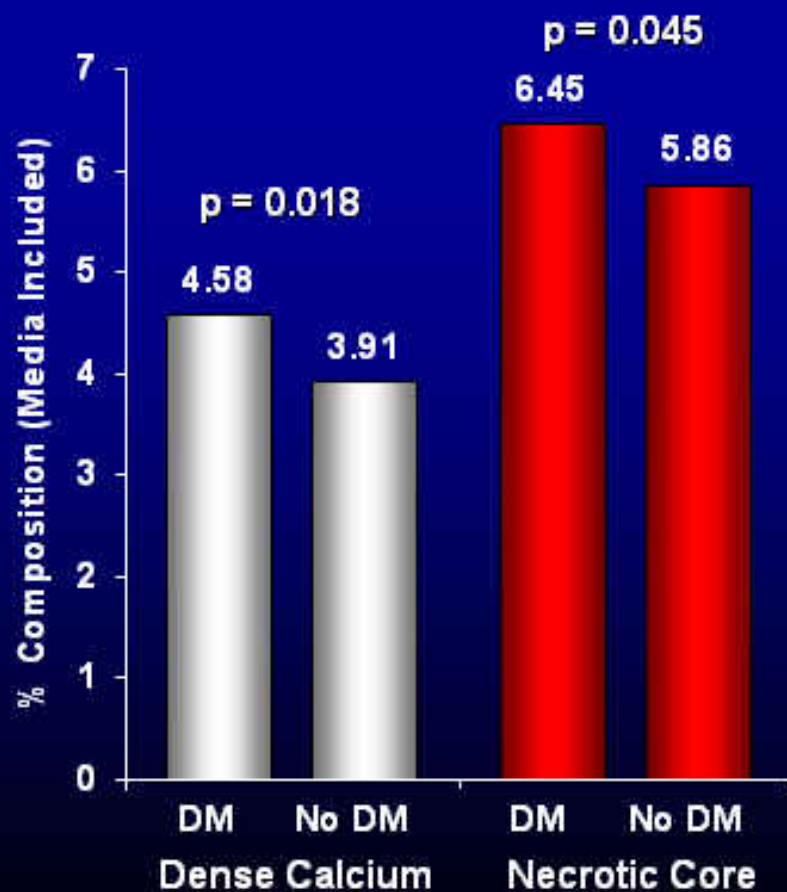

# Hypertension

# Hypercholesterolemia

# Diabetes and Plaque Composition: Global VH Registry

# Multivariable Analysis

These 2 factors account for only 3% of the variance in mean % whole vessel necrotic core.

## Conclusions

- 1. Plaque composition did vary by several traditional cardiovascular risk factors**
- 2. Specifically; age, insulin treated DM, and hypertension were associated with whole vessel mean necrotic core. (Univariate analysis)**
- 3. However, only age and insulin-treated diabetics were multivariable predictors of an increase in whole vessel mean % necrotic core**
- 4. Traditional risk factors account for < 3% of the variability in mean whole vessel necrotic core**

**VH Registry:**  
**880 Pts USA & Europe**  
***Entire Pullback Analysis***

## Description of Predictive Analysis: Predictors of Increase in the Average CSA Necrotic Core

✧ The following variables were used in a stepwise regression

- ACS (Y/N)
- Diabetes (Y/N)
- Hypertension (Y/N)
- Prior MI (Y/N)
- FH of CAD (Y/N)
- HDL (High/Low)
- LDL (High/Low)
- CRP (High/Low)
- Ischemia (Y/N)
- Current Smoker (Y/N)

✧ Variables were allowed to enter the model if they achieve a univariate p-value of  $\leq 0.1$

✧ Variables remained in the model if they explain a significant ( $p \leq 0.05$ ) amount of the variation

✧ Resulting model was confirmed with three types of stepwise model building: forward, backward, and mixed

✧ Variables remaining were: ACS, Diabetes, and HDL

# The CSA of Necrotic Core is Predicted by Key Risk Factors

# Patients with MI had Significantly more **Fibrosis** and **Necrotic Core** than Patients without MI

■ MI (n=163) ■ No MI (n=716) 1 unknown

Percent of plaque volume that was calcified and fibrofatty were not significant ( $p > 0.05$ ) for MI

# **Description of Predictive Analysis: *Predictors of Current MI***

✧ The following variables were used in a stepwise regression

- ✧ % necrotic core in plaque volume
- ✧ cube root [% calcified in plaque vol]
- ✧ Sq Rt [% fibro-fatty in plaque vol]
- ✧ % of fibrosis in plaque vol
- ✧ Log [Ave Necrotic Core CSA]
- ✧ Log [Ave Calcified CSA]
- ✧ Log [Ave Fibro-Fatty CSA]
- ✧ Log [Ave Fibrous CSA]
- ✧ Drug or alcohol abuse?
- ✧ Current Smoker
- ✧ Chronic inflammatory disease?
- ✧ Family History of CAD
- ✧ Congestive heart failure?
- ✧ Prior CABG
- ✧ Prior MI
- ✧ Lipid Treatment
- ✧ Lipid Treatment [Diet/Exercise]
- ✧ Diabetes?
- ✧ Hypertension?
- ✧ Prior cardiac history?
- ✧ Gender [F]
- ✧ Age years[ $\geq 58$  &  $< 68$ ]
- ✧ Age years[ $< 58$ ]

## VH Registry: 880 Pts USA & Europe *Entire Pullback Analysis*

### *Predictors of AMI*

- ✧ The strongest predictors of mean CSA **Necrotic Core** were: diabetes, ACS, Low HDL
- ✧ The strongest predictors of current AMI were: high % **necrotic core**, prior cardiac history, prior CABG, CHF, positive FH

# VH Registry: 880 Pts USA & Europe

## *Entire Pullback Analysis*

### *Predictors of AMI (cont)*

- ☆ The data supports post mortem and epidemiological data of the role of **necrotic core** in identifying pts at risk for AMI
- ☆ Targeting **necrotic core** for either systemic medication or local therapy (stent) seems justified to prevent future events

# Insulin Dependent Diabetes is Associated with Increased Amount of **Necrotic Core**

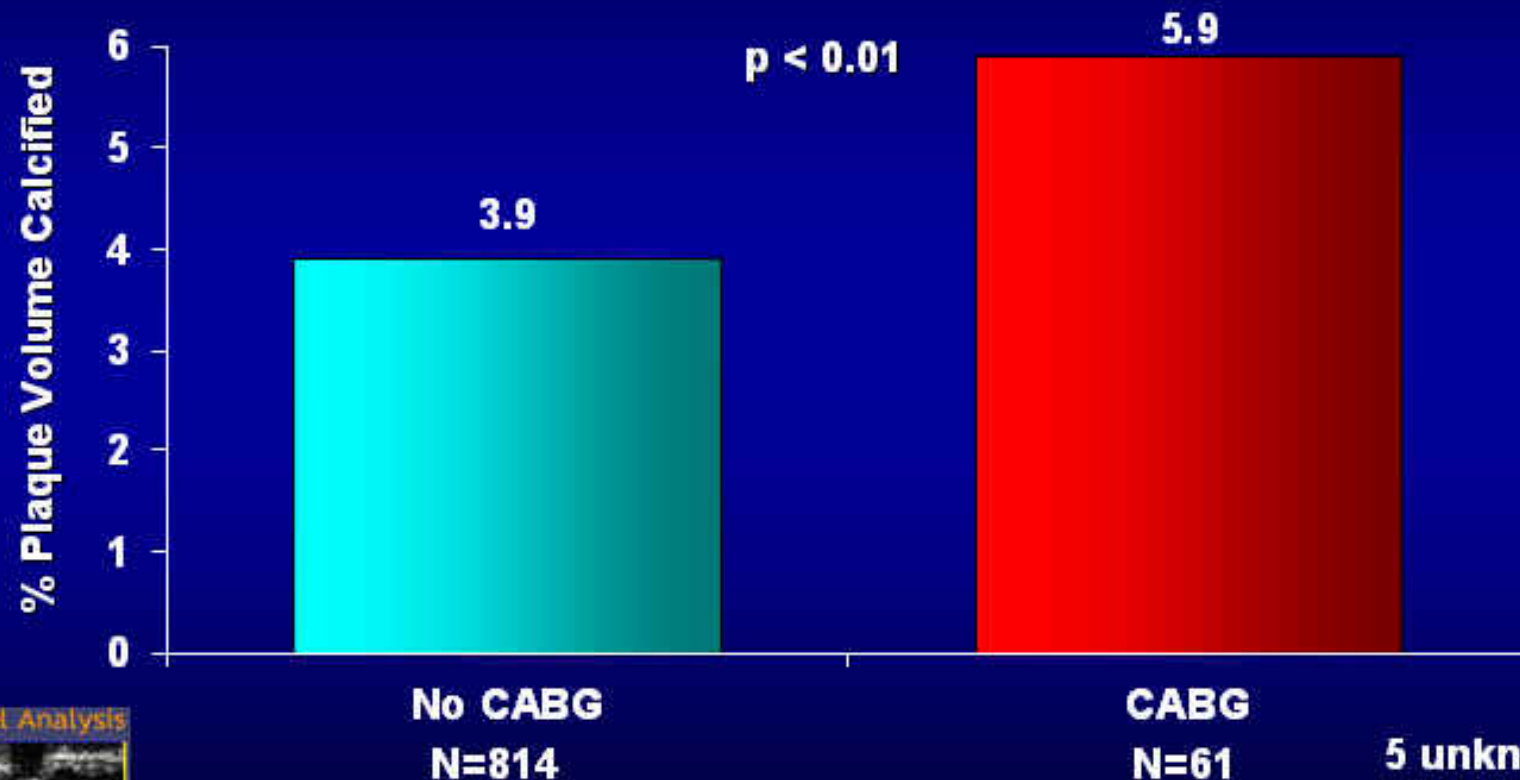

Percent of plaque volume that was calcified, fibrous or fibro-fatty was not significant ( $p > 0.05$ ) for insulin-dependence

# Hypertension is Associated with Increased Amount of Calcium

Percent of plaque volume that was fibrous, fibro-fatty or necrotic core was not significant ( $p > 0.05$ ) for HTN

# The Arteries of Patients with Prior CABG were Significantly more Calcified than the Arteries of Patients without Previous CABG

Percent of Plaque that was Fibrous and FibroFatty were not significant ( $p > 0.05$ ) for CABG, and borderline for Necrotic Core ( $p = 0.06$ )

## **VH Registry: 880 Pts USA & Europe - *Pullback Analysis***

### **Relationship of Plaque Components to Risk Factors**

#### **☆ Significantly increased Necrotic Core**

- Insulin dependent diabetes
- Prior cardiac history
- Prior AMI or CABG
- Old age, particularly females

#### **☆ Significantly increased Calcium**

- Older age
- Congestive Heart Failure
- Prior Cardiac History or CABG
- Hypertension

#### **☆ Significant increase in Fibrosis**

- Prior AMI

# IVUS-VH Derived Plaque Phenotyping

## **IVUS-VH Derived Plaque Phenotyping**

### ***Conclusions:***

- ✧ **IVUS-VH is a feasible imaging platform to define lesions in target vessels of PCI patients**
- ✧ **There were 1.5 non-culprit lesions for every 1 culprit lesion in target vessels**
- ✧ **Identified 3 distinct phenotypes that differed with respect to composition and plaque burden ( $p < 0.001$ )**
- ✧ **Tight correlation between lesion phenotype and mean lumen area plaque composition ( $p < 0.001$ )**

## IVUS-VH Derived Plaque Phenotyping

### ***Conclusions:***

☆ Among pts with > one lesion:

- 34 (46%) had lesions of single phenotype
- 37 (50%) had lesions of two phenotypes
- 3 (4%) had lesions of three phenotypes

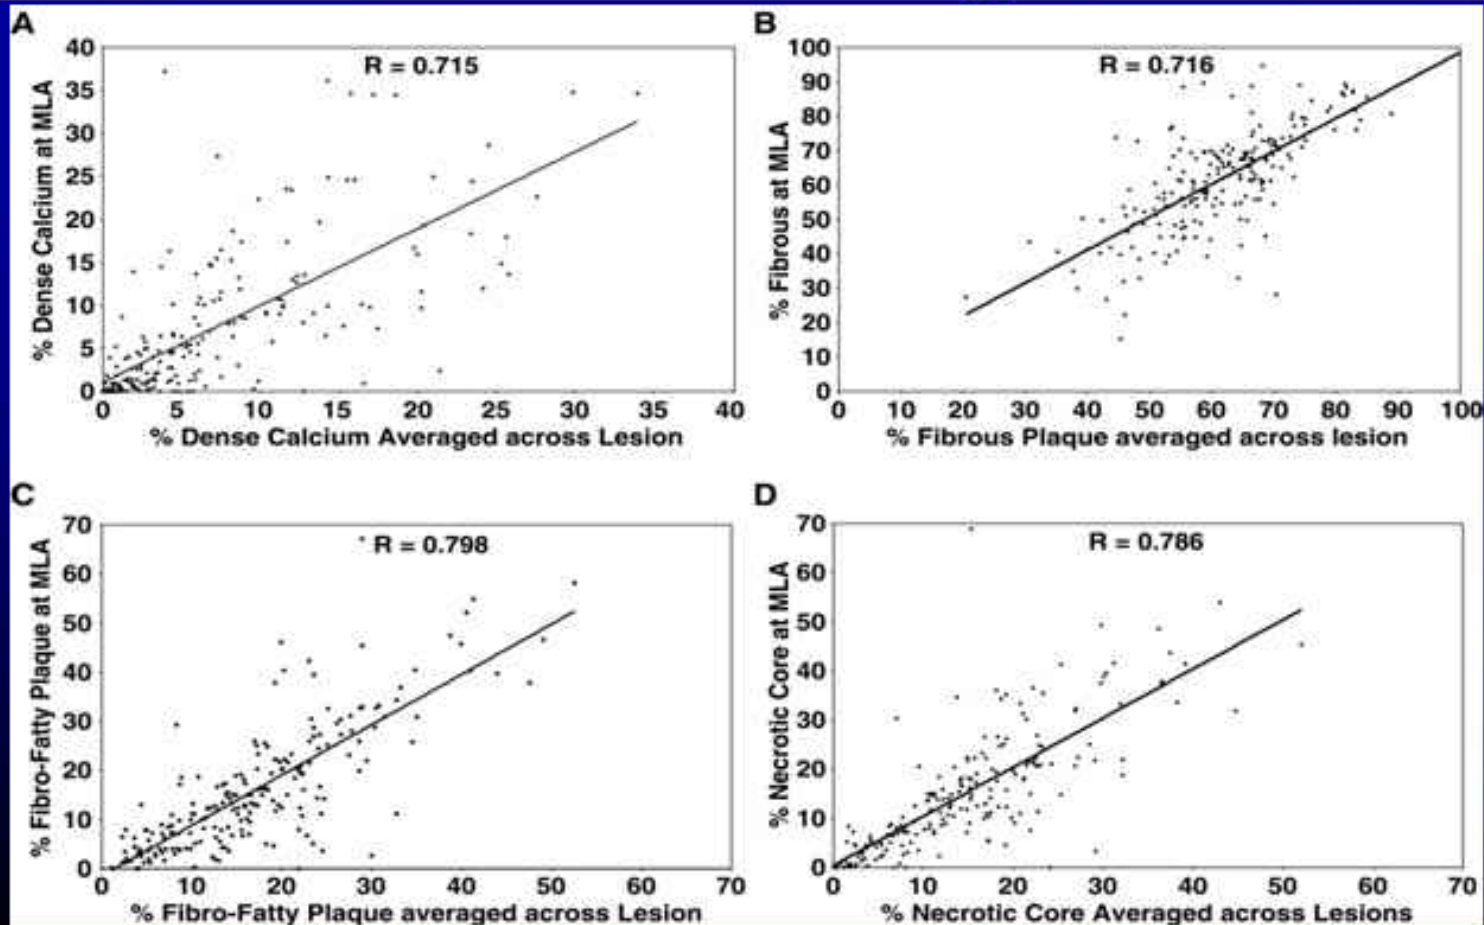

☆ Trend for clustering of culprit plaques to phenotypes 2 and 3 ( $p = 0.077$ )

## IVUS-VH Derived Plaque Phenotyping in Coronary Arteries of Patients Undergoing PCI

N = 76		N (%)
Age (yrs $\pm$ SD)		64.1 $\pm$ 11.9
Male		50 (69)
Caucasian		70 (92)
Diabetes		22 (30)

# IVUS-VH Derived Plaque Phenotyping in Coronary Arteries of Patients Undergoing PCI

## Correlation Between Lesion Segment and MLA

# IVUS-VH Derived Plaque Phenotyping in Coronary Arteries of Patients Undergoing PCI

## **IVUS-VH Derived Plaque Phenotyping in Coronary Arteries of Patients Undergoing PCI**

***Mid America Heart Institute***

- ✧ **Three experienced, independent IVUS technicians performed quantitative assessment of media-adventitia border, the lumen, lesion of interest, and proximal and distal 5 mm**
- ✧ **Identify 4 basic plaque types**
  - **Fibrous – dark green**
  - **Fibro-fatty – light green**
  - **Dense Ca<sup>++</sup> – Wwhite**
  - **Necrotic Core - Red**

## **Clinical Correlates of Virtual Histology**

### ***Take-Home Message***

- ✧ **Routine use of IVUS essential for reducing restenosis rates in DES**
- ✧ **Particularly useful if **stented length**  $\geq$  **35-40 mm**, **diabetic** patients, and in **multiple vessel** stenting**

216 pts (5.8%) non-target PCI,  
mean f/u 163 ± 99 days*

✧ 86.9% of lesions requiring repeat PCI ≤ 60%  
at original study

✧ Lesions < 50% at initial angio 60.5%

✧ Lesions > 70% at initial angio 13.4%

✧ MVD at original angio 76.4%

## Clinical Progression of Incidental, Asymptomatic Lesions Discovered During Culprit Vessel Coronary Intervention

✧ Progression in same artery	39%
✧ Progression in different artery	61%
✧ Clinical Presentation:	
Acute Coronary Syndrome	68.5%
Stable Angina	24.1%
Atypical Symptoms	6.8%

# Non Q-Wave MI Pts had Highest Mean Necrotic Core CSA, but when Adjusted to Total Plaque Volume, Difference Not Significant

*p = 0.06 Stable Angina vs. non-Q wave MI*

# The FibroAtheroma

Fibrous and/or Fibro-Fatty plaques with Necrotic Core (>10% of total plaque volume). Goal of using VH to increase the value of IVUS will very likely be in differentiating the Fibro-Atheroma from the other three plaque types.
