

# Fully Integrated Invasive Imaging Solutions: On-line Networking of Angiography, IVUS, FFR, OCT, ICE, VP Imaging, Etc

*Gary S. Mintz, MD*

*Cardiovascular Research Foundation*

*New York, NY*

# Prior to EuroPCR, physicians were asked to pick the top 3 reasons for not using IVUS

- I cannot afford it - 55.6%
- I have difficulties with image interpretation - 5.6%
- Takes too much time - 33.3%
- Does not reach difficult lesions – 25%
- Adds unnecessary risk to the procedure - 11.1%
- I am not an expert - 22.2%
- No evidence that it improves outcomes - 27.8%
- Good for studies, no need for it in practice - 27.8%
- Diagnostic tool, no therapeutic implication - 16.7%

# How to be more efficient. . .

- **Train Technicians\*, Nurses, and/or Fellows**
  - Knowledge of imaging systems, catheters, and imaging protocol(s)
  - Immediately available and patient care and flow of PCI procedure not interrupted
  - System and catheter preparation, image optimization and annotation
  - Make measurements, interpret images, and provide feedback to physician during procedure
  - Archive cases onto CDs
  - Keep procedure logs and generate reports
- **The more you do, the more efficient you get.**

## Historical IVUS Workflow

Search for IVUS Console in neighboring labs

If not in use, unplug and transport 400 lb. system

Plug in console and ECG lead to power up

Enter Patient information manually via keyboard

Plug in catheter and begin imaging

Trace borders

Make measurements by hand

Estimate tissue composition based on gray-scale 'shades'

# Integrated IVUS Workflow

## BSC

Enter Patient information manually via keyboard

Plug in catheter and begin imaging

Confirm automatic borders & measurements

## Volcano

Digital transfer of patient information via DICOM connection

COLUMBIA UNIVERSITY  
MEDICAL CENTER

NewYork-Presbyterian

The University Hospital of Columbia and Cornell

# Volcano V-Fusion

• Controls can be bedside or in the control room

## BSC iLab

# Greyscale IVUS

- Perhaps the best all around technique for assessing overall atherosclerosis burden and unusual lesions pre-intervention; guiding interventional procedures - including intermediate lesion and LM disease assessment; stent and length sizing and stent optimization; and assessing stents at follow-up
- Limited usefulness in assessing plaque composition (except calcium), thrombus formation, vulnerable plaques
- The workhorse in the cath lab

# Beyond greyscale IVUS...

Physiology  
(CFR/FFR)

ICE

Angioscopy

VP Imaging  
(Spectroscopy, etc)

Greyscale  
IVUS

VH-IVUS

OCT/OFDI

*Non-invasive Imaging (From TEE to CTA to ...)*

CARDIOVASCULAR RESEARCH

NewYork-Presbyterian  
The University Hospital of Columbia and Cornell

# Physiology (CFR/FFR)

- Perhaps the best technique available for assessing the hemodynamic significance of intermediate (non-LM) lesions
- Not useful for selecting stent size and length
- Limited usefulness for optimizing stent expansion and lesion coverage

# Volcano V-Fusion **also** **includes FFR**

- Controls can be bedside or in the control room

## BSC iLab

# VH/IB-IVUS

- **Supplements greyscale IVUS by assessing plaque composition and detecting vulnerable plaques, but not thrombus**
- **Not a stand-alone technique – but this data is acquired at the same time as greyscale IVUS**

# VP Imaging

- Multiple techniques – spectroscopy, palpography, VV imaging, etc.
- Not useful for assessing hemodynamic significance of intermediate lesions, guiding interventional procedures, or assessing stents at follow-up
- Probably not stand-alone techniques – but prototypes exist to combine some of these with greyscale IVUS

# OCT/OFDI

- Perhaps the best all around technique for assessing vulnerable plaques and thrombus formation and, especially, for assessing stent malapposition, neointimal stent strut coverage, at follow-up.
- Has the potential to replace greyscale IVUS as the best all around technique for assessing lesions pre-intervention and guiding interventional procedures
- Limited usefulness for assessing overall atherosclerosis burden because of limited penetration
- Prototype designs exist to combine this with IVUS in a single catheter

# Angioscopy

- Perhaps the best technique for assessing thrombus
- Also useful for assessing vulnerable and/or ruptured plaques and stent neointimal coverage

	TTE	TEE	ICE
Transseptal catheterization	+	++	++
Percutaneous balloon mitral valvuloplasty	++	+++	++
Transseptal closure of ASD, PFO, VSD	+	++	++ (phased array)
Alcohol septal ablation of HOCM	++	++	-
Percutaneous MV repair	+	+++	+
Percutaneous LV assist device placement	-	++	++
Percutaneous stented AoV prosthesis placement	-	+	+
Balloon or blade atrial septostomy	++	++	++
Placement of LAA occlusion devices	-	++	++
Myocardial and intraventricular biopsy	++	++	++ (phased array)
Congenital heart applications (completion of Fontan procedure, coarctation repair, etc)	+	+	+
Placement of aortic endograft	-	-	+

- *No documented role or benefit in the literature*

+ *Anecdotal reports of use and benefit exist, but further study is needed to delineate*

++ *Advantages favor use when available*

+++ *Clearly documented benefit or role.*

# The right tool for the right job

In clinical medicine when faced with a diagnostic or therapeutic decision, we must always choose the right tool for the right job. Invasive imaging is no different. None of the available tools is a single, all-in-one solution. All of them are important in specific situations. Physicians must learn to interpret and use these techniques correctly.

# The next steps in image integration. . .

- We must be able to integrate these many modalities into the cath lab – physically and operationally.
- It is impractical and inefficient to have separate (and different) catheters, consoles, data management, and standard operating procedures for each technique
- The first step is to have one console – and, therefore, one data management and SOP – that can be used with multiple imaging catheters
- The second step is to have a single catheter perform multiple functions – i.e., combined ultrasound and optical imaging.

# The next steps in image integration. . .

- Although the data files are large, invasive images need to be stored with or linked to the cineangiograms
  - There should be one patient record that contains the clinical record as well as all of the imaging data
  - All images (not just the cineangiograms) must be viewable as they occurred in sequence during the procedure – similar to the hyperlinks that I used in this presentation

# The next steps in image integration. . .

- “Big iron” has been reluctant to share its storage storage by incorporating even IVUS - and greyscale IVUS studies are relatively small digital files compared to next generation imaging techniques.
- Fully integrated imaging may require a third party solution to provide huge, efficient, and expandable data storage facilities and algorithms.

# The next steps in image integration. . .

- Once the images have been integrated into a network, they can become available for electronic transfer to
  - Core laboratory
  - Online image interpretation service
  - Electronic medical record filing
  - Referring and consulting physicians

# A personnel-intensive solution is no longer acceptable

- **Train Technicians\*, Nurses, and/or Fellows**
  - Knowledge of imaging systems, catheters, and imaging protocol(s)
  - Immediately available and patient care and flow of PCI procedure not interrupted
  - System and catheter preparation, image optimization and annotation
  - Make measurements, interpret images, and provide feedback to physician during procedure
  - Data and image management

**After a more than a decade of discussion,  
the first steps toward image integration have  
been accomplished with IVUS and FFR.  
Therefore, there is no reason that this  
cannot be extended to include other  
invasive imaging techniques.**
