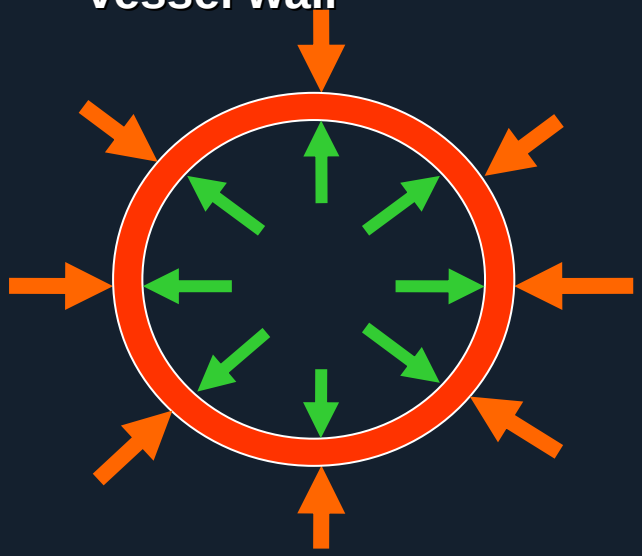
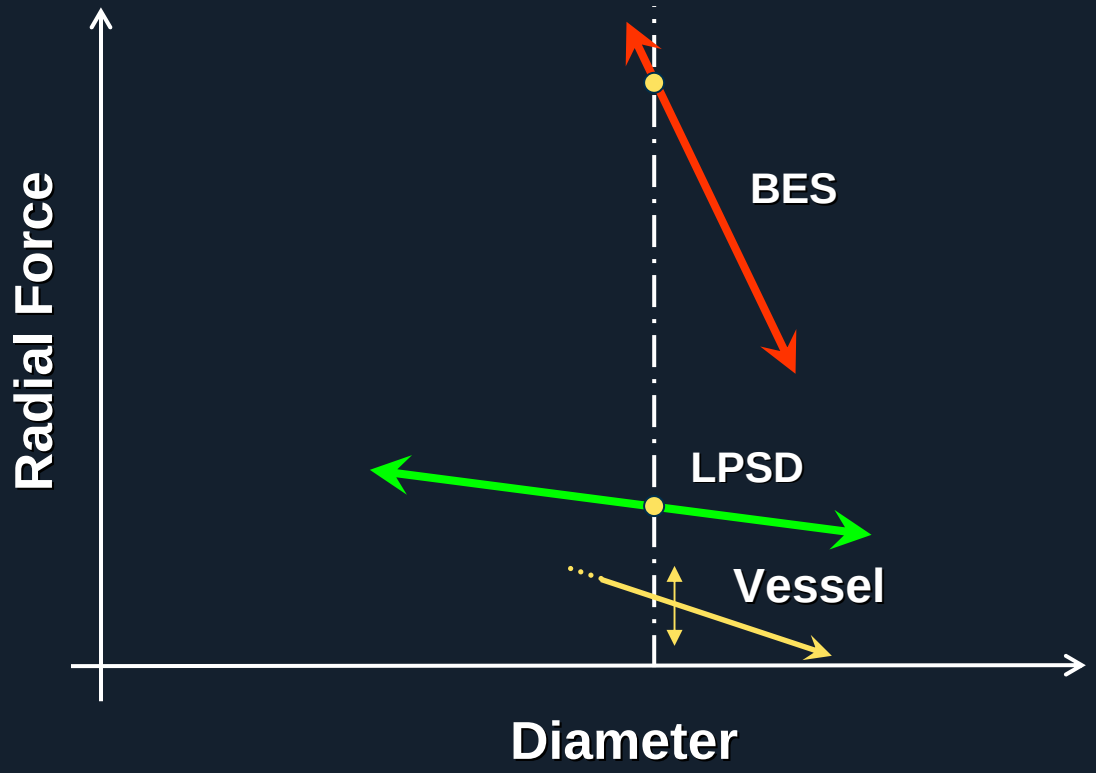
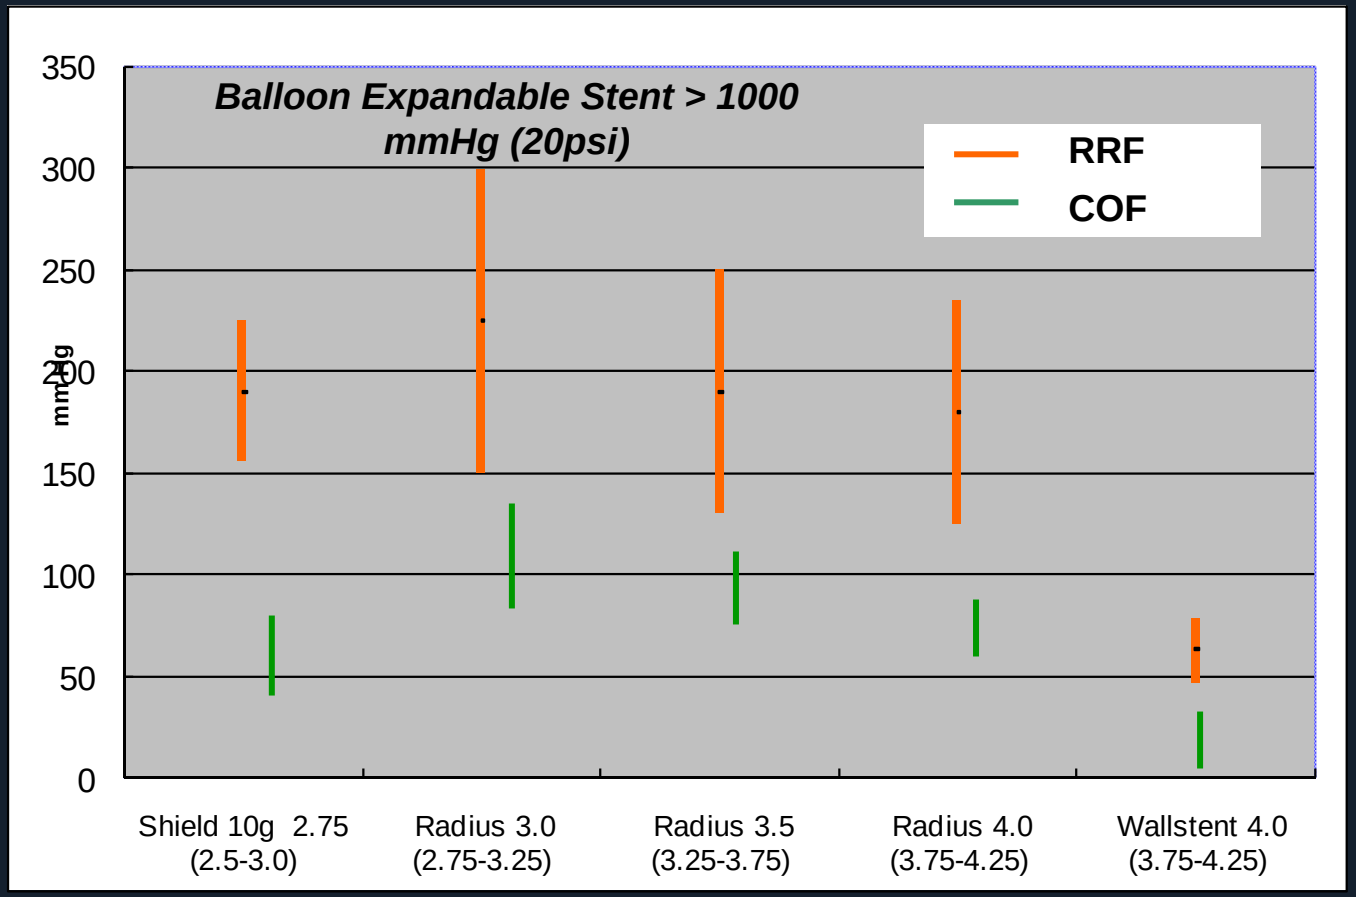
Mechanics of the vProtect Vascular Shield: RRF and COF

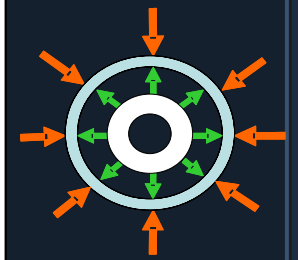
- **Radial Resistive Force (RRF): Force the Shield resists the recoil of the plaque and vessel wall**
- **Chronic Outward Force (COF): Force the Shield exerts on the plaque and vessel wall**





Mechanics of the vProtect Vascular Shield Compared to Other SE Stents





Maximum to Minimum Indicated Diameter.
High crush resistance / chronic outward force ratio

Testing performed on MSI tester May 2007

Experimental Data: 28 Days

- Porcine normal coronary model (11 animals).
- 30 coronary arteries were randomized to receive:
  - Vascular shields (3.5 x 16.8 mm, n=10)
  - VisionTM stents (Abbott, 3.0 x 18mm, n=10)
  - XienceTM stents (Abbott, 3.0 x 18 mm, n=10)

- Devices deployed at 110% of pre-intervention RVD.

- Stented arteries were imaged with angiography and IVUS at baseline, post-implant and after 1 month.

- Optical Coherence Tomography (OCT) at 1 month.

- Pathology analysis at CVPath.

vProtect Luminal Shield: Study Design

Non-randomized 30 patients study
Consecutive enrollment
2 OUS centers
10 to 20 patients/center

General inclusion criteria
- Symptomatic CAD undergoing PCI

Angiographic Inclusion Criteria
- Single *de novo* lesion: ≥50% DS by QCA
- IVUS: minimal calcification
- RVD 2.75 – 3.5 mm, LL ≤ 20 mm

Exclusion Criteria
- Known allergy or sensitivity to Nitinol
- Contraindication to anticoagulants
- Major surgery within 30 days
- Severe calcification by IVUS
- Anatomical exclusion criteria

PRIMARY ENPOINT
- Post-procedural DS ≤30%
- IVUS MLA ≥ 4 mm^2
- In-hospital through 30 days MACE*

SECONDARY ENDPOINT
- 9 month angiographic restenosis
- 9 month TLR, TVR, TVF
- 9 month MACE*

*MACE: Death, MI, stent thrombosis, TLR.

First in Human Study: Study Design of the vProtect Luminal Shield

Characteristic	All Patients N=30
Age (mean yrs.)	59.0 ± 7.7
Gender	Male: 17 (57%) Female: 13 (43%)
Diabetes Mellitus (%)	37%
Hypertension (%)	70%
Previous MI (%)	33%
Coronary Artery Disease	1-Vessel 11/30 (37%) 2-Vessel 14/30 (47%) 3-Vessel 5/30 (17%)

j2 Can we add more data, like treated vessel (culprit), timi flow, etc...I would like to make this table to look more robust.

Conclusions (1)

- A self-expandable “vascular shield” has been successfully developed aiming to match the mechanical forces needed to “compress” the necrotic core avoiding fibrous cap rupture.
- Preliminary animal experience suggest that this device achieves smaller lumen areas, significantly less degree of vascular injury and comparable degree of neointimal formation compared with state of the art vascular devices.
- In animals vascular shields have demonstrated favorable biocompatibility with no marked difference to control stents in the qualitative or quantitative indices of healing of the arterial injury, foreign body reaction and endothelialization.
- Diseased animal models suggest that the vascular shield could compress and remodel the necrotic core, maintaining acceptable luminal gain and not causing additional vascular injury.

Conclusions (2)

- The implantation of a low pressure self-expandable scaffolding (vPredict™ Luminal Shield) is feasible and safe in patients with obstructive CAD achieving an adequate luminal gain and complete apposition after implantation.
- Complete device apposition is the rule, however, smaller lumen areas are consistently found.
- The primary safety endpoint was achieved. Thirty days clinical follow up demonstrated that the early safety profile is maintained.
- Due to its intrinsic mechanical properties, this device may improve the outcomes of PCI by inducing less injury at the time of implantation. Thus, this device could be indicated in specific patient subsets such as acute coronary syndromes.
