The University Hospital of Columbia and Cornell

The **PROSPECT** Trial

Background

- **PROSPECT** was a prospective, multicenter natural history study using 3 vessel multimodality intracoronary imaging to identify those lesions which place pts at risk for unexpected adverse cardiovascular events

The **PROSPECT** Trial

700 pts with ACS

UA (with ECGΔ) or NSTEMI or STEMI >24°
undergoing PCI of 1 or 2 major coronary arteries
at up to 40 sites in the U.S. and Europe

Metabolic S.

- Waist circum
- Fast lipids
- Fast glu
- HgbA1C
- Fast insulin
- Creatinine

Biomarkers

- Hs CRP
- IL-6
- sCD40L
- MPO
- TNF α
- MMP9
- Lp-PLA2
- others

PCI of culprit lesion(s)

Successful and uncomplicated

Formally enrolled

PI: Gregg W. Stone

Sponsor: Abbott Vascular; Partner: Volcano

The **PROSPECT** Trial

3-vessel imaging post PCI

**Culprit artery, followed by
non-culprit arteries**

Angiography (QCA of entire coronary tree)

IVUS

Virtual histology

Palpography (n= \sim 350)

*Proximal 6-8
cm of each
coronary
artery*

Meds rec

Aspirin

Plavix 1yr

Statin

Repeat biomarkers

@ 30 days, 6 months

**F/U: 1 mo, 6 mo,
1 yr, 2 yr,
 \pm 3-5 yrs**

MSCT

Substudy

N=50-100

**Repeat imaging
in pts with events**

PROSPECT: Primary Endpoint

MACE attributable to non-culprit lesions*

- Cardiac death
- Cardiac arrest
- Myocardial infarction
- Rehospitalization due to
 - Unstable angina
 - Progressive angina

Most severe

Hierarchical

Least severe

MACE during FU were adjudicated by the CEC as attributable to culprit lesions (those treated during or before the index hospitalization) or non culprit lesions (untreated areas of the coronary tree) based on angiography (+ECGs, etc.) at the time of the event; events occurring in pts without angiographic follow-up were considered indeterminate in origin.

PROSPECT: Methodology

Virtual histology lesion classification

Lesions are classified into 5 main types

1. Fibrotic

2. Fibrocalcific

3. Pathological intimal thickening (PIT)

4. Thick cap fibroatheroma (ThCFA)

5. VH-thin cap fibroatheroma (VH-TCFA)
(presumed high risk)

PROSPECT 82910-012: 52 yo♂

2/13/06: NSTEMI, PCI of MLAD

2/6/07 (51 weeks later): NSTEMI attributed to LCX

Index 2/13/06

QCA PLCX DS 28.6%

Event 2/6/07

QCA PLCX DS 71.3%

PROSPECT 82910-012: Index 2/13/06

Baseline PLCX

**QCA: RVD 2.82 mm,
DS 28.6%, length 6.8 mm**

IVUS: MLA 5.3 mm²

VH: ThCFA

1. ThCFA

PROSPECT: Baseline Features

N = 697*

*3 patients who were never consented were de-registered

PROSPECT: Imaging Summary

Length of coronary arteries analyzed (core lab)

Mean (mm)	Angiography (N=697)	IVUS (N=673)	VH data* (N=623)
LM	9.3 ± 4.3	12.8 ± 9.8	12.8 ± 9.7
LAD	153.5 ± 41.1	73.3 ± 34.1	73.8 ± 33.7
LCX	132.7 ± 49.9	63.3 ± 36.1	63.6 ± 36.0
RCA	148.3 ± 45.1	85.2 ± 39.6	85.5 ± 39.4
Total per pt	437.9 ± 86.4	192.0 ± 97.7	206.7 ± 85.4
Total all pts	305,228.3	129,216.8	128,757.9

* Note: VH data doesn't register if there is no plaque

PROSPECT: Imaging Summary

Virtual histology (N=2811 lesions in 611 pts)

- Mean plaque composition -

- Dense calcium
- Fibrotic
- Fibrofatty
- Necrotic core

Plaque subtype	N=2811
Fibrotic	2.5%
Fibrocalcific	1.2%
PIT	35.9%
Fibroatheroma	57.4%
- Thick cap	36.2%
- VH-TCFA	18.9%
- Single, - Ca	5.2%
- Single, + Ca	0.5%
- Multiple, - Ca	9.5%
- Multiple, + Ca	6.1%

PROSPECT: MACE

Number at risk

	0	1	2	3
ALL	697	557	506	480
CL related	697	590	543	518
NCL related	697	595	553	521
Indeterminate	697	634	604	583

PROSPECT: MACE

3-year follow-up, hierarchical

	All	Culprit lesion related	Non culprit lesion related	Indeterminate
Cardiac death	1.9% (12)	0.2% (1)	0% (0)	1.7% (11)
Cardiac arrest	0.3% (2)	0.3% (2)	0% (0)	0% (0)
MI (STEMI or NSTEMI)	2.7% (17)	1.7% (11)	1.0% (6)	0.2% (1)
Rehospitalization for unstable or progressive angina	15.4% (101)	10.4% (69)	10.7% (68)	0.8% (5)
Composite MACE	20.4% (132)	12.9% (83)	11.6% (74)	2.7% (17)
Cardiac death, arrest or MI	4.9% (31)	2.2% (14)	1.0% (6)	1.9% (12)

Rates are 3-yr Kaplan-Meier estimates (n of events)

PROSPECT: MACE

3-year follow-up, hierarchical

	All	Culprit lesion related	Non culprit lesion related	Indeterminate
Cardiac death	1.9% (12)	0.2% (1)	0% (0)	1.7% (11)
Cardiac arrest	0.3% (2)	0.3% (2)	0% (0)	0% (0)
MI (STEMI or NSTEMI)	2.7% (17)	1.7% (11)	1.0% (6)	0.2% (1)
Rehospitalization for unstable or progressive angina	15.4% (101)	10.4% (69)	10.7% (68)	0.8% (5)
Composite MACE	20.4% (132)	12.9% (83)	11.6% (74)	2.7% (17)
Cardiac death, arrest or MI	4.9% (31)	2.2% (14)	1.0% (6)	1.9% (12)

Rates are 3-yr Kaplan-Meier estimates (n of events)

PROSPECT: Multivariable Correlates of Non Culprit Lesion Related Events

Independent predictors of lesion level events by Cox Proportional Hazards regression

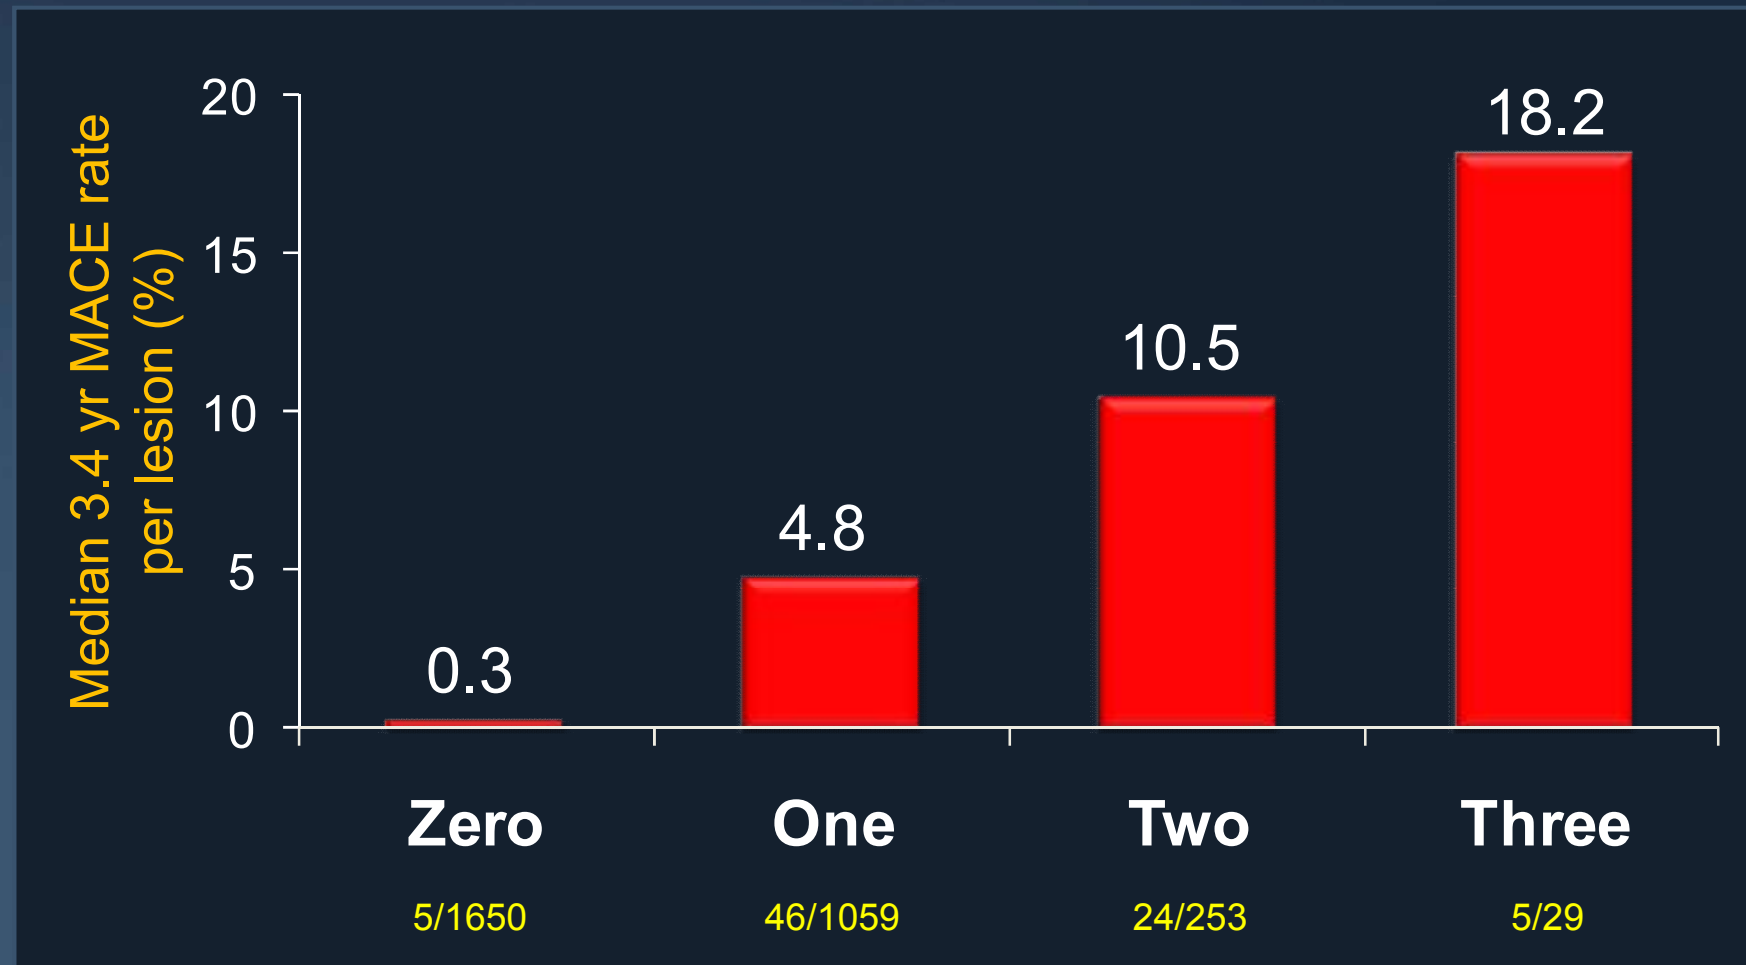

<u>Variable</u>	<u>HR [95% CI]</u>	<u>P value</u>
$PB_{MLA} \geq 70\%$	5.03 [2.51, 10.11]	<0.0001
VH-TCFA	3.35 [1.77, 6.36]	0.0002
$MLA \leq 4.0 \text{ mm}^2$	3.21 [1.61, 6.42]	0.001

Variables entered into the model: minimal luminal area ($MLA \leq 4.0 \text{ mm}^2$); plaque burden at the MLA ($PB_{MLA} \geq 70\%$); external elastic membrane at the MLA ($EEM_{MLA} < \text{median} (14.1 \text{ mm}^2)$); lesion length $\geq \text{median} (11.2 \text{ mm})$; distance from ostium to MLA $\geq \text{median} (30.4 \text{ mm})$; remodeling index $\geq \text{median} (0.94)$; VH-TCFA.

PROSPECT: Correlates of Non Culprit Lesion Related Events

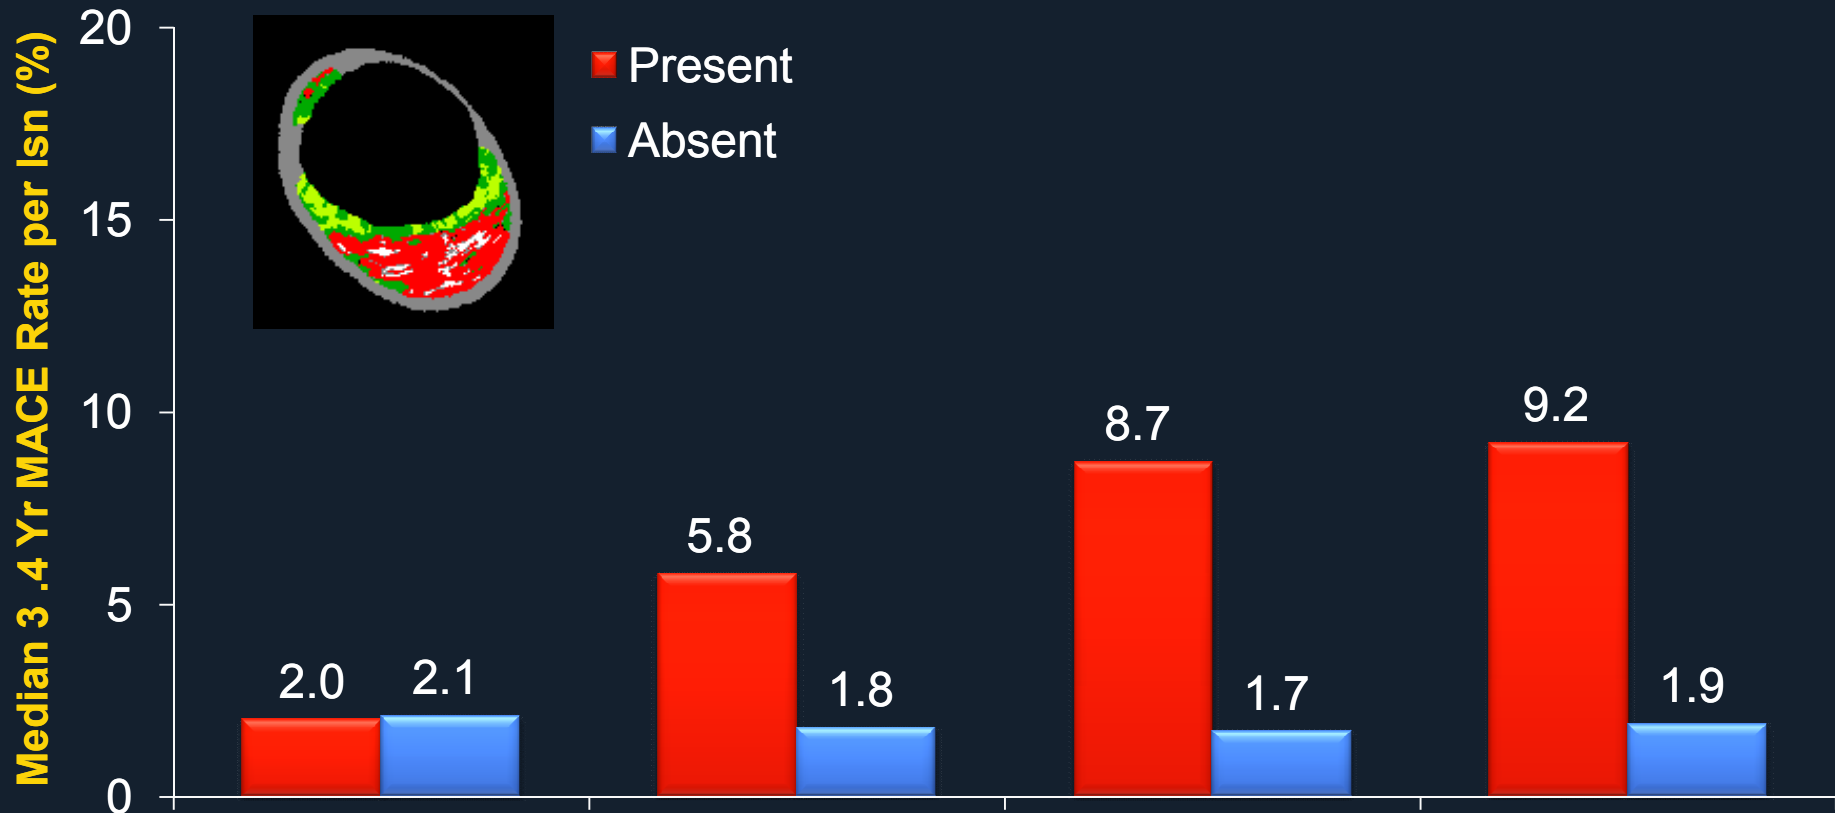

Number of factors present: $PB_{MLA} \geq 70\%$, $MLA \leq 4.0\text{mm}^2$ or TCFA

PB = plaque burden at the MLA

PROSPECT: Thick CFA and Non Culprit Lesion Related Events

	ThCFA	ThCFA + MLA $\leq 4.0\text{mm}^2$	ThCFA + PB $\geq 70\%$	ThCFA + PB $\geq 70\%$ + MLA $\leq 4\text{mm}^2$
Lesion HR	0.92 (0.52, 1.63)	3.41 (1.75, 6.65)	5.17 (2.59, 10.32)	5.02 (1.99, 12.63)
P value	0.77	0.0003	<0.0001	<0.0001
Prevalence*	67.6%	22.7%	15.6%	8.3%

*Likelihood of one or more such lesions being present per patient. PB = plaque burden at the MLA

PROSPECT: Non Fibroatheromas and Non Culprit Lesion Events

Median 3 .4 year MACE rate per lesion (%)

Lesion HR	0.22 (0.10, 0.49)	1.22 (0.44, 3.39)	1.25 (0.17, 9.01)	2.60 (0.36, 18.84)
P value	0.0002	0.70	0.83	0.34
Prevalence*	67.9%	19.7%	5.6%	2.7%

*Likelihood of one or more such lesions being present per patient. PB = plaque burden at the MLA

The header features a dark blue background with three small images on the left: a grayscale angiogram, a cross-sectional grayscale image of a vessel, and a color-coded cross-sectional image of a vessel. The word "PROSPECT" is written in large, bold, yellow capital letters in the center.

PROSPECT

- The Big Question -

Does **PROSPECT** Support the
Use of Invasive Imaging to
Diagnose and Treat Vulnerable
Plaque with DES?

PROSPECT: Implications

- The relatively low prevalence of high-risk lesions (~1 in 5 pts), coupled with the fact that when they become symptomatic they usually present with angina and not death or MI, suggests that 3-vessel imaging to identify and prophylactically stent these lesions is not warranted in ACS patients who are revascularized and treated with optimal medical therapy.
- Similarly, if a high risk non ischemia-producing lesion happens to be found (e.g. 3 year event rate >10%), since most patients present with angina, prophylactic DES cannot be recommended absent a large, randomized trial.

PROSPECT: Implications

- However, millions of persons per year who have not been diagnosed with CAD and are not receiving optimal medical therapy die, arrest or develop MI every year.
- This suggests that future investigation should focus on identifying asymptomatic or minimally symptomatic pts with large plaque burden, small MLA and TCFAs through noninvasive screening (e.g. MSCT), for consideration of enhanced medical therapy and possible angiography.
