

# Vulnerable plaque update

## Pathophysiology of ACS assessed by OCT

**Takashi Akasaka, MD**

**Department of Cardiovascular Medicine  
Wakayama Medical University, Japan**

*Wakayama Medical University*

# Progression of atherosclerotic plaque

## Different Types of Vulnerable Plaque

( Naghavi M, et al. Circulation 2003;108:1664-1672 )

# Criteria for defining vulnerable plaque

( Naghavi M, et al. Circulation 2003;108:1664-1672 )

## Major criteria

- **Active inflammation**  
(monocyte/macrophage and sometimes T-cell infiltration)
- **Thin cap (< 65  $\mu\text{m}$ ) with large lipid core**
- **Endothelial denudation with superficial platelet aggregation**
- **Fissured plaque**
- **Stenosis > 90%**

## Minor criteria

- **Superficial calcified nodule**
- **Glistening yellow**
- **Intraplaque hemorrhage**
- **Endothelial dysfunction**
- **Outward (positive) remodeling**

# OCT vs histology

**Fibrous plaque**

**Fibro-calcific plaque**

**Fibro-lipidic plaque**

**Signal rich, homogenous**

**Signal poor, clear border**

**Signal poor, diffuse border**

Yabushita H, et al. *Circulation*, 106:1640-1645, 2002

Kume T, et al. *Am J Cardiol* 97: 1172 - 75, 2006

*Wakayama Medical University*

# Red & white thrombus

Red thrombus

Protrusion mass  
with shadow

White thrombus

Protrusion mass  
without shadow

Mixed thrombus

Protrusion mass  
with & without shadow

Kume T, Akasaka T, et al ( Am J Cardiol 97:1713-1717, 2006 )

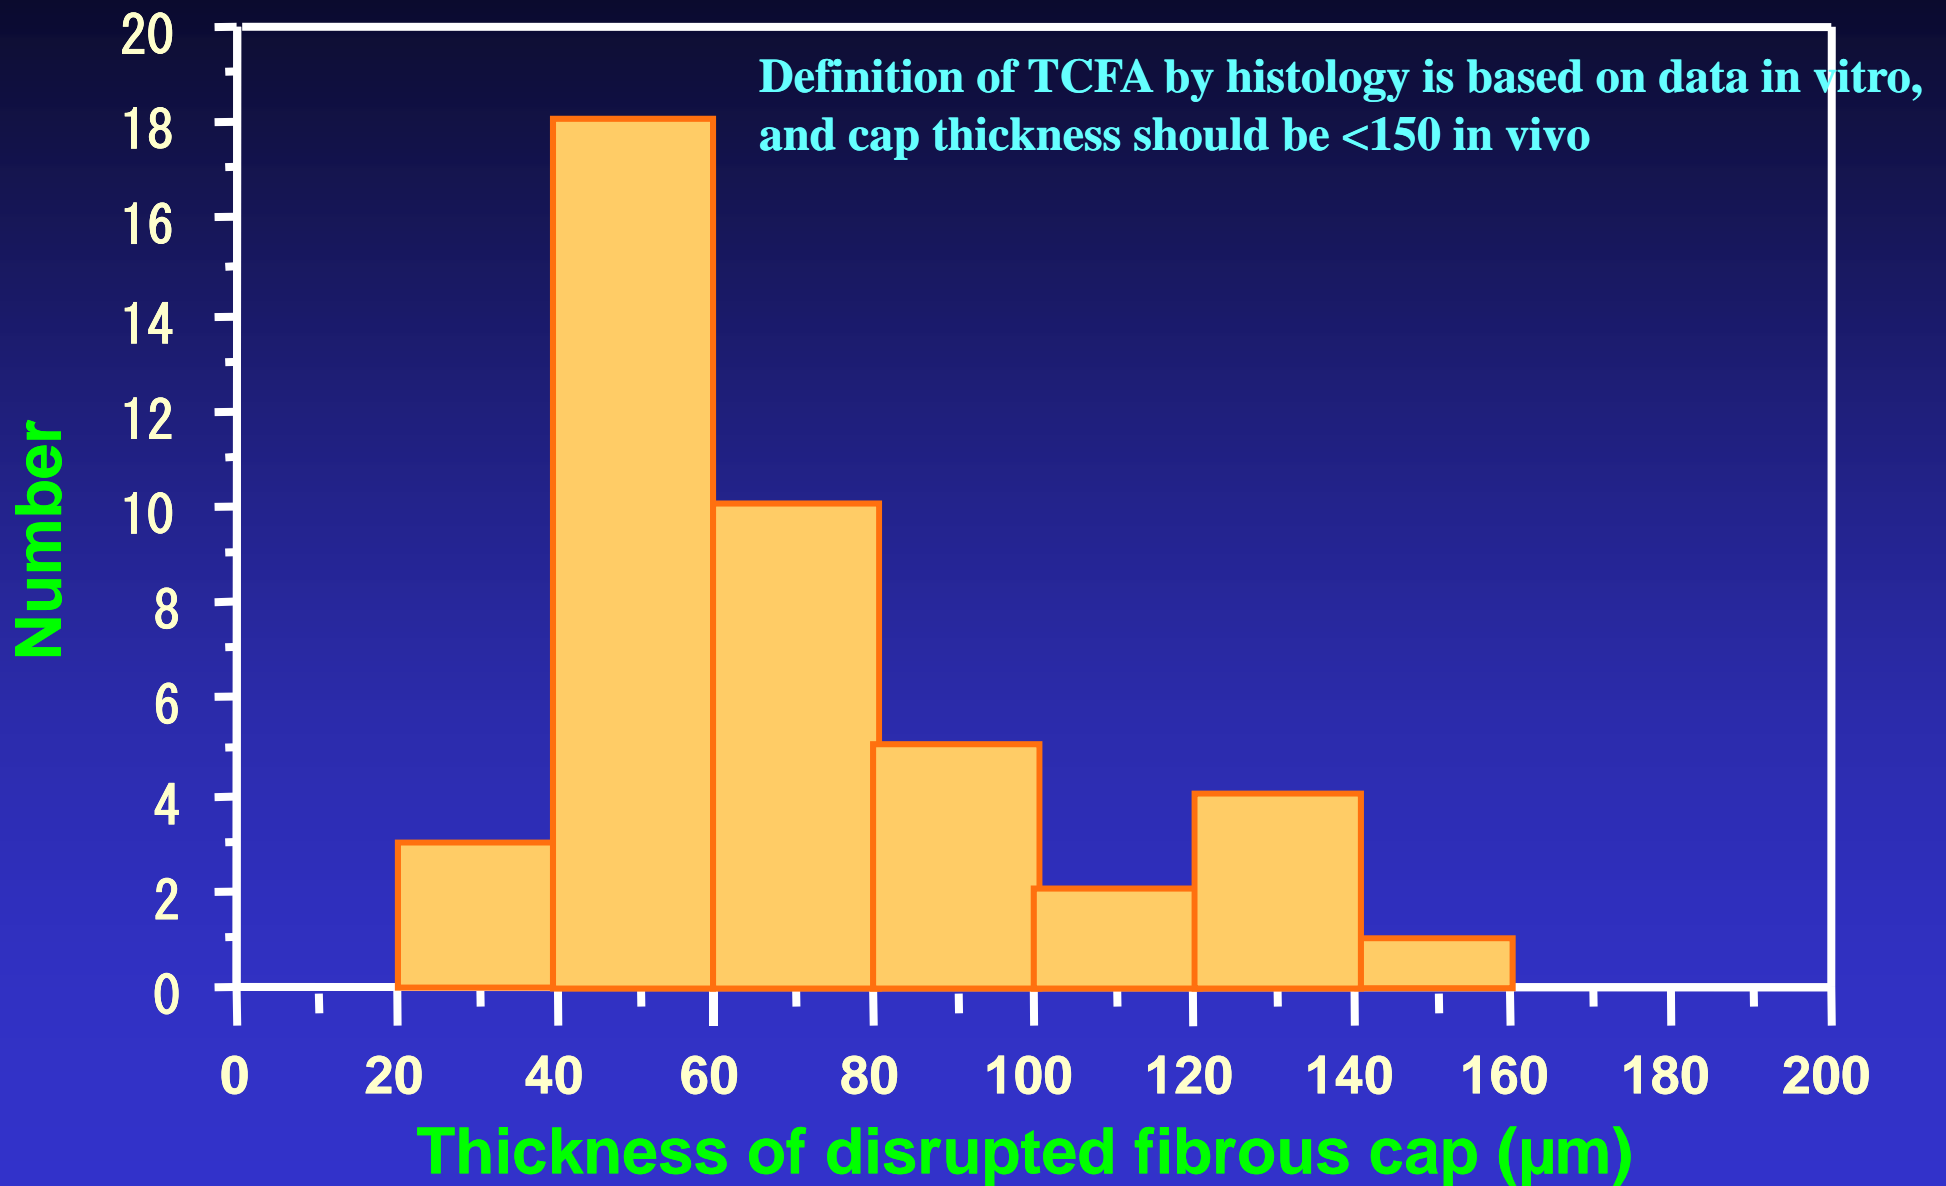

Kubo T, Akasaka T, et al. ( J Am Coll Cardiol 50:933-939,2007)

# Plaque rupture (Plaque disruption)

# Distribution of disrupted fibrous-cap thickness

# Plaque ulceration

## Erosion

# Comparison of plaque Images in AMI (OCT vs. CAS vs. IVUS) n=30

(Kubo T, Akasaka T, et al. J Am Coll Cardiol 50:933-939,2007)

	OCT	*CAS	**IVUS	*p	**p
Plaque Rupture (%)	73	47	40	0.035	0.009
Ulceration (erosion) (%)	23	3	0	0.022	0.005
Thrombus (%)	100	100	33	1.000	<0.001
Red thrombus (%)	100	90	-	0.076	-
White thrombus (%)	100	93	-	0.150	-
TCFA ( $\leq 65\mu\text{m}$ ) (%)	83	-	-	-	-
Fibrous cap thickness ( $\mu\text{m}$ )	49 $\pm$ 21	-	-	-	-
LRP (Lipid Arch $> 180^\circ$ ) (%)	83	-	67	-	NS

TCFA; Thin Cap Fibro-Atheroma, LRP; Lipid Rich Plaque

# OCT findings in unstable angina

Class I

Class II

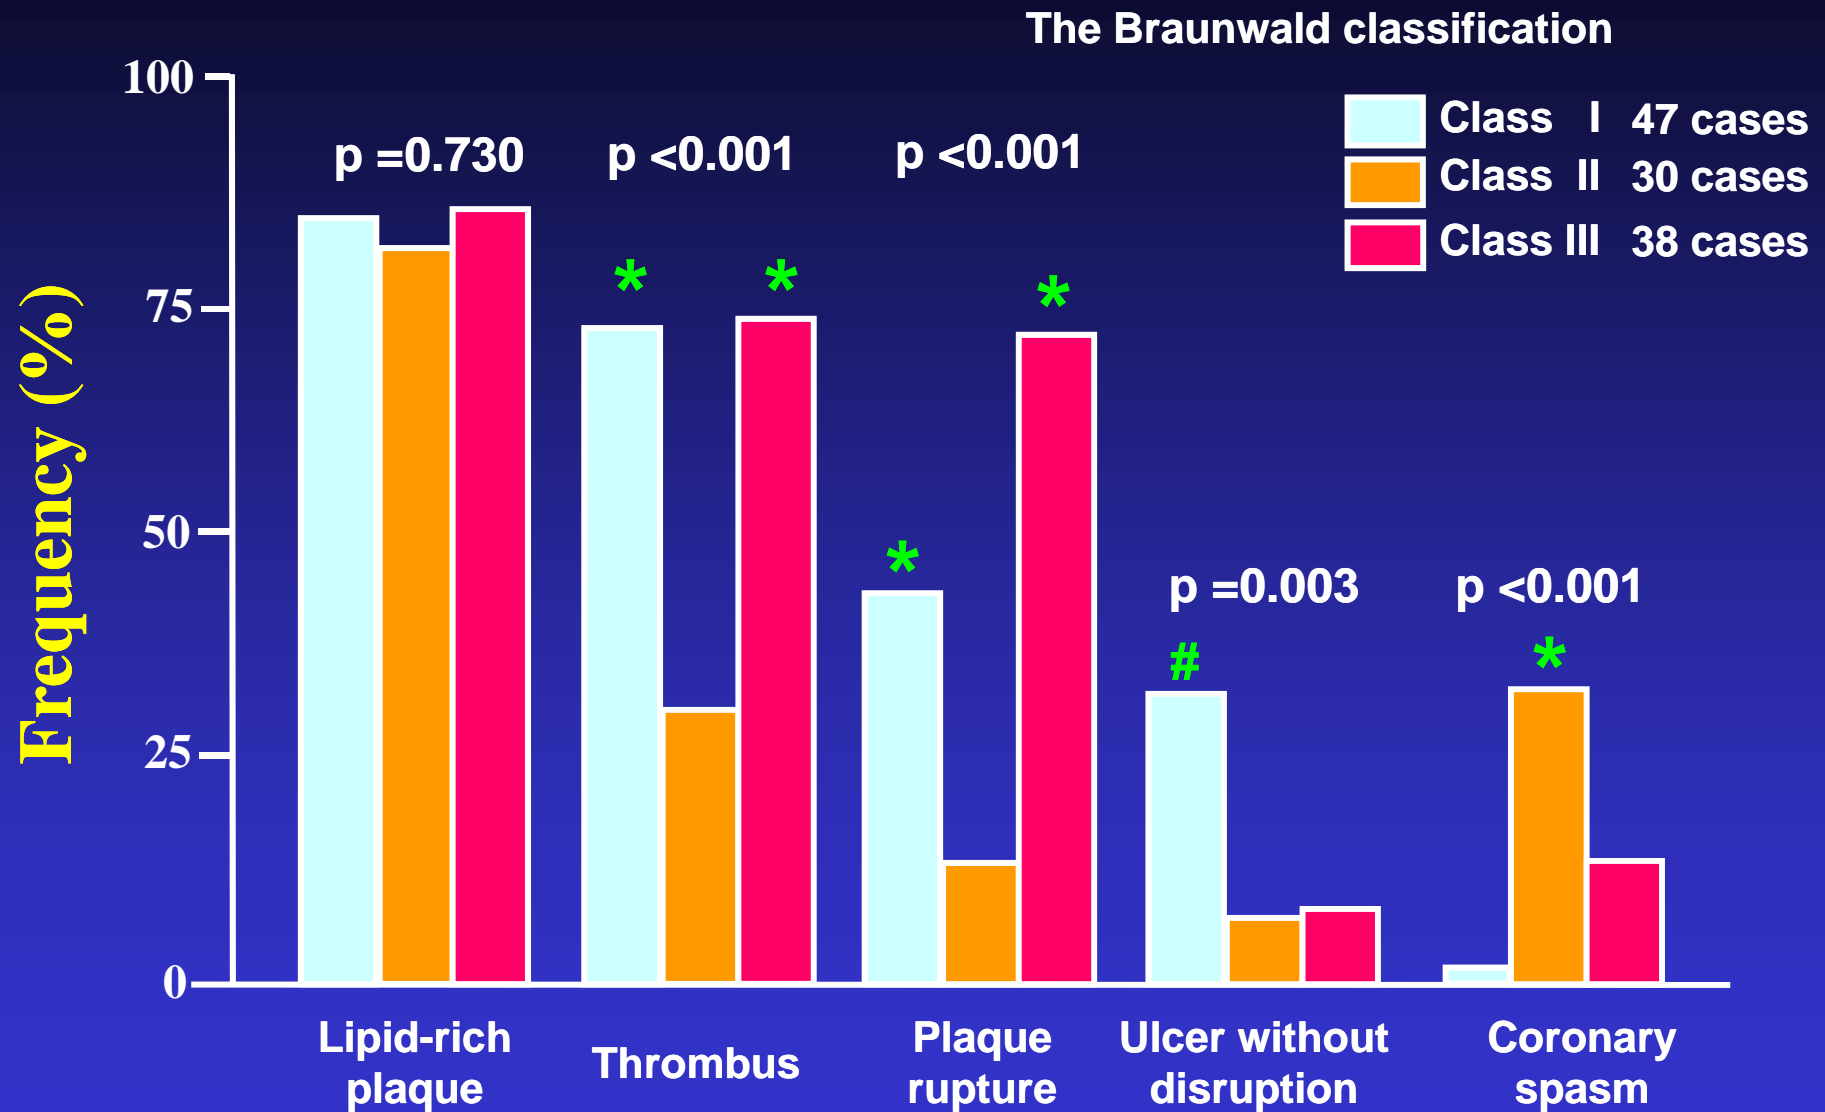

Class III

(Mizukoshi M, et al. Am J Cardiol 2010, 106: 323-328 )

Wakayama Medical University

# OCT findings in 115 cases with unstable AP

(Mizukoshi M, et al. Am J Cardiol 2010, 106: 323-328)

Wakayama Medical University

# Clinical manifestation & Fibrous cap thickness, MLA of the culprit lesion

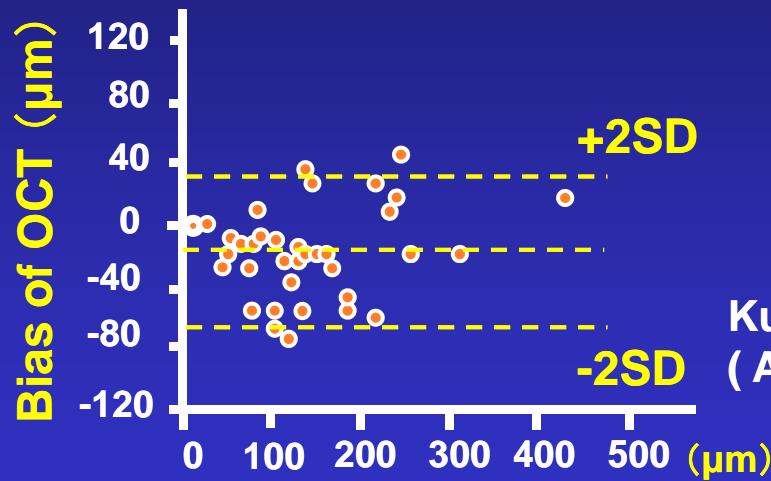

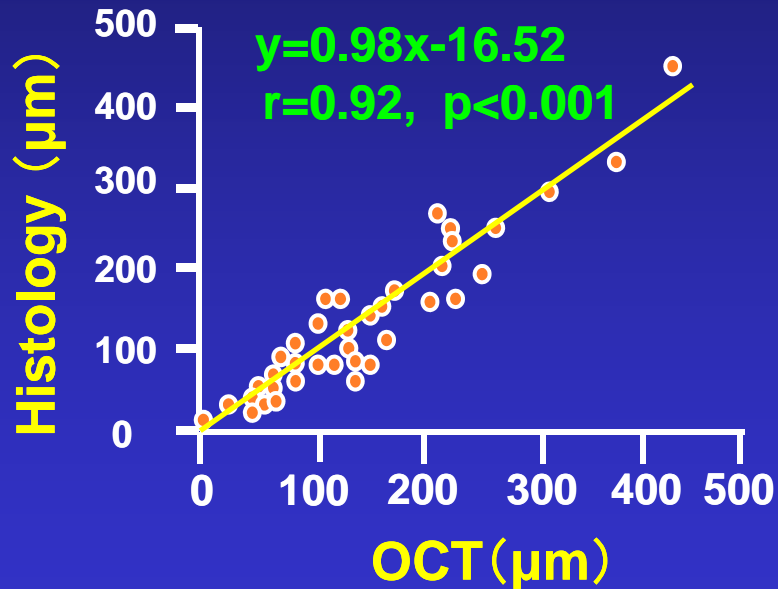

**Braunwald classification**

(Mizukoshi M, et al. Am J Cardiol 2010, 106: 323-328)

Wakayama Medical University

# Thin-cap fibroatheroma (TCFA)

Kume T, Akasaka T, et al.  
( Am Heart J.152:755, 2006)

TCFA is thought to be vulnerable based on histological studies, and possibility to identify TCFA has been demonstrated by several pilot OCT studies.

# OCT findings of macrophages

Low M $\phi$

High M $\phi$

OCT

CD68  
(macrophage)

# Identification of macrophage

Extremely high signal with rapid attenuation on the surface of the vessel wall or within fibrous tissue might demonstrate macrophage accumulation.

# Corresponding Images of OCT and Angioscopy

(Kubo T, et al. J Am Coll Cardiol Intv 1:74-80,2008)

# Angioscopy vs OCT

## Plaque color vs lipid size

## Plaque color vs fibrous cap thickness

(Kubo T, et al. J Am Coll Cardiol Intv 1:74-80,2008)

# Criteria for defining vulnerable plaque

( Naghavi M, et al. Circulation 2003;108:1664-1672 )

## Major criteria

- Active inflammation  
(**monocyte/macrophage** and sometimes **T-cell infiltration**)
- **Thin cap (< 65  $\mu\text{m}$ ) with large lipid core**
- Endothelial denudation with **superficial platelet aggregation**
- **Fissured plaque**
- **Stenosis > 90%**

## Minor criteria

- **Superficial calcified nodule**
- **Glistening yellow**
- **Intraplaque hemorrhage**
- Endothelial dysfunction
- **Outward (positive) remodeling**

# Micro-channels in non-culprit plaques

# Microchannel within plaque (Vasavasorum)

# Vessel Wall Neovascularization in Atherosclerosis

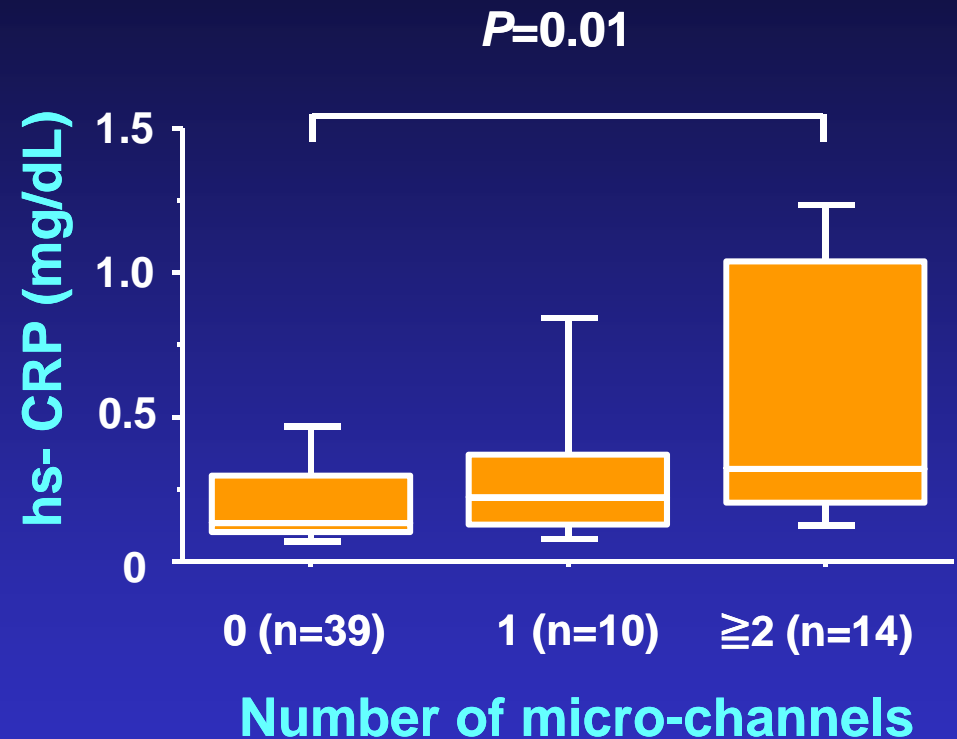

(J Am Coll Cardiol 2007;49:2073–80)

# Microchannel within plaque (Vasavasorum)

Kitabata H, et al. Am J Cardiol. 2010;105:1673-1678

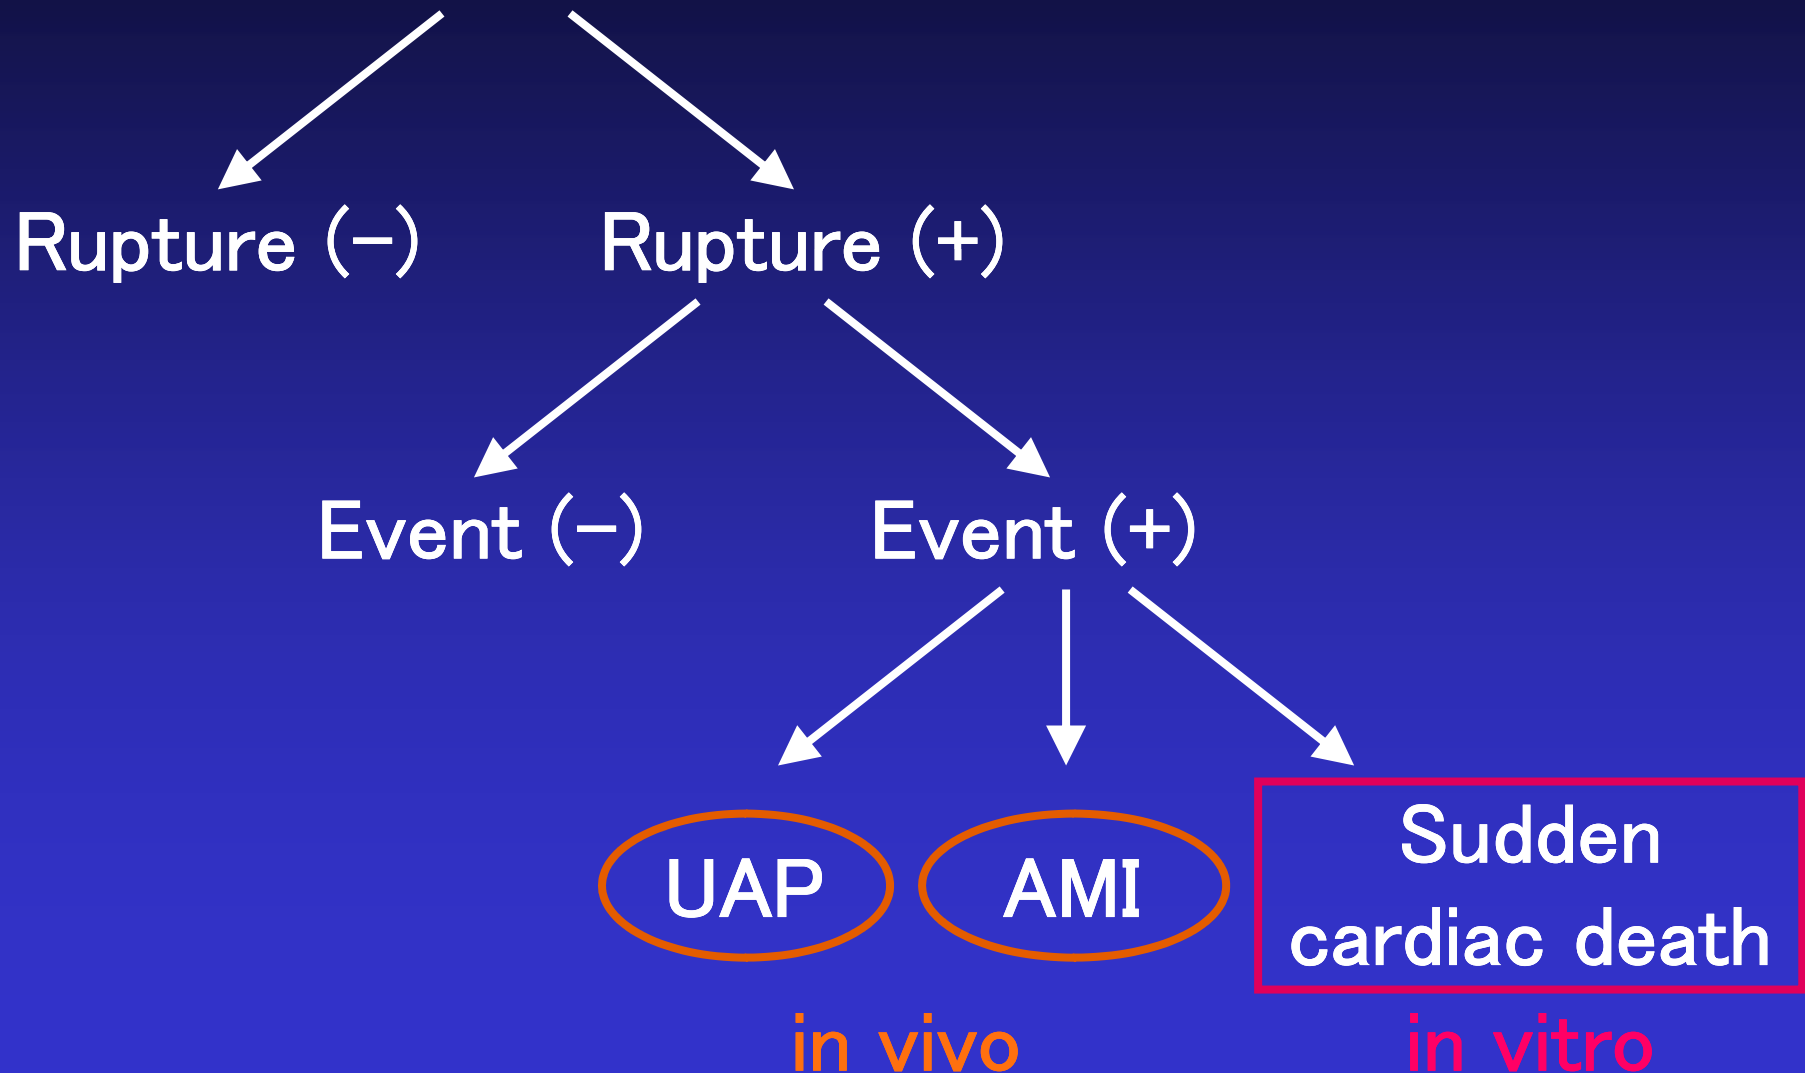

The presence of microvasculature (vasavasorum) may demonstrate the plaque vulnerability.

# Identification of vulnerable plaque

- Plaque prone to rupture

# Unstable AP

(Tanimoto T, et al. Circ J 2009 ; 73:187-189 )

# Unstable AP

Plaque disruption may occur without clinical event, and it might be difficult to identify the plaque prone to rupture even in prospective study.

(Tanimoto T, et al. Circ J 2009 ; 73:187-189 )

*Wakayama Medical University*

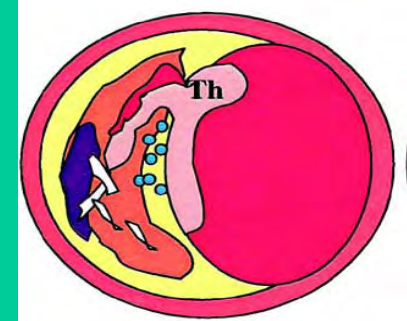

# OCT findings in each atheromatous stage

**Thick fibrous-cap atheroma**

**Thin fibrous-cap atheroma**

**Ruptured plaque**

OCT is a high-resolution imaging modality for plaque characterization.

# Progression of atherosclerotic plaque

Libby, P. *Circulation* 2001;104:365-372

# LDL vs Atheroma volume

# OCT assessment of non-culprit lesion (47y.o. male)

## Baseline

T.Chol. 200 mg/dl  
TG 79 mg/dl  
HDL-C 47 mg/dl  
LDL-C 128 mg/dl

## 9 month later

T.Chol. 187 mg/dl  
TG 133 mg/dl  
HDL-C 49 mg/dl  
LDL-C 98 mg/dl

(Takarada S, et al. Atherosclerosis 202: 491- 497, 2009 )

# Changes of plaque characteristics by statin

(Takarada S, et al. Atherosclerosis 202: 491-497, 2009 )

	Baseline	Follow-up	p
<b>Statin group</b>			
Fibrous cap thickness ( $\mu\text{m}$ )	114 $\pm$ 83	162 $\pm$ 75	<0.01
Lipid arc (degrees)	132 $\pm$ 37	116 $\pm$ 23	<0.01
<b>Non-statin group (Control group)</b>			
Fibrous cap thickness ( $\mu\text{m}$ )	117 $\pm$ 78	129 $\pm$ 54	ns
Lipid arc (degrees)	129 $\pm$ 37	128 $\pm$ 28	ns

# Change in fibrous cap thickness

(Takarada S, et al. Atherosclerosis 202: 491- 497, 2009 )

## Statin Group

## Control Group

# Methods

Consecutive 160 NSTEMI patients who underwent emergency PCI

Exclusion:

3 left main, 6 CHF, 8 CKD (Cr>1.5 mg/dl)  
12 lipid-lowering therapy

110 patients could be evaluated by IVUS & OCT

9-month  
follow-up period

28 patients withdraw

82 patients were enrolled in this study

58 patients (71%) received statin during follow up

**OCT and IVUS study :**

Measured plaque :

Non-culprit site atheroma  
(>10mm proximal or distal  
to the PCI site)

Analysis

Fibrous-cap thickness (OCT)  
Total atheroma volume (IVUS)

**Laboratory examination :**

LDL-C, HDL-C, hs-CRP  
( The days of discharge,  
& the time of follow-up )

# Representative case of plaque stabilization : 66yo, male

primary PCI

Total atheroma volume=63mm<sup>3</sup>

3

Fibrous-cap thickness=90μm

9-months follow-up

Total atheroma volume=61mm<sup>3</sup>

3

Fibrous-cap thickness=310μm

# The correlation between the lipid profile and the % change of fibrous-cap thickness (FCT) and total atheroma volume (TAV).

**%TAV and %LDL/HDL were positively correlated ( $p<0.01$ ,  $r = 0.42$ ).**  
**%FCT and %CRP were inversely correlated ( $p<0.01$ ,  $r = -0.44$ ).**

## Univariable and multivariable logistic regression analyses as predictors of plaque stabilization

	univariable analysis : OR(95% CI)	p-value		multivariable analysis :OR(95%CI)	p-value
age,y	0.52 (0.93-1.04)	p=0.60			
gender	1.38 (0.46-5.4)	p=0.86			
HLP	0.91(0.33-2.51)	p=0.86			
HT	0.53 (0.17-1.09)	p=0.08		0.72 (0.22-1.7)	p=0.73
DM	0.56 (0.14-0.97)	p=0.04		0.74 (0.23-2.4)	p=0.84
statin	3.57 (1.66-12.6)	p=0.002		<b>1.45 (1.15-15.9)</b>	<b>p=0.02</b>

“Plaques stabilization” was defined by decreasing TAV and increasing FCT.  
In the present study, 31 plaques (39%) stabilized.

(Takarada S, et al. JACC Interv. 2010;3:766-772 )

# Cardiovascular event-free survival probability according to high or low hs-CRP and LDL cholesterol levels

Ridker PM et al. *N Engl J Med* 2002;347:1557-65

# JUPITER trial

*N Engl J Med* 2008;359:2195-207.

**A Primary End Point**

No. at Risk

Rosuvastatin	8901	8631	8412	6540	3893	1958	1353	983	538	157
Placebo	8901	8621	8353	6508	3872	1963	1333	955	531	174

These data demonstrated that hs-CRP provide the risk prediction better than LDL-C.

## Case 56 y.o. male

- This gentleman had chest pain on exertion from March 20, 2010.
- The frequency and severity of chest pain increased gradually .
- He was admitted to our hospital with a diagnosis of unstable angina (changing pattern) on April 12, 2010.
- He had multiple coronary risk factors such as hypertension, dyslipidemia, diabetes mellitus, family history and smoking.

# ECG on admission (56 y.o. male)

# Case 1. 56 y.o. male

## Labo data

<b>LDH:</b>	<b>156</b>	<b>e-GFR:</b>	<b>68.6</b>

# UAP (56 y.o. male)

# LAD in UAP (56 y.o. male)

# LCx in UAP (56 y.o. male)

# Case 1. 56 y.o. male

## CAG (4/13)

#3: 50%, #6: 90%, #11:75%

## PCI to the LAD lesion

Guiding catheter: 6F Profit SS 3.5, Guide wire: Runthrough

1. OCT (C7) to the LAD
2. Pre-dilatation by a 3.5×12mm semi-compliant balloon
3. Stent implantation (3.5×25mm BMS)
4. Post-dilatation (18 atm)
5. OCT(C7) to the LAD & LCx

## Staged PCI to the LCX lesion (4/20)

1. OCT (C7) to LCx
2. Stent implantation (3.5×18mm BMS)
3. Post-dilatation (18 atm)

# LCx one week later in UAP (56 y.o. male)

# Conclusions

By higher resolution (10 $\mu$ m) and superior ability of tissue characterization, OCT may allow us to

- assess coronary lesion morphology in ACS in detail.
- identify various types of vulnerable plaque correctly.
- estimate the effects of various drugs on plaque characteristics.
- assess the pathophysiology of coronary artery.

# Effect of pitavastatin on plaque morphology (WHHL-MI rabbit )

Lipid arc assessed by OCT

Lipid arc :

\*\* P<0.01 vs control Scheffie's test Mean±SEM

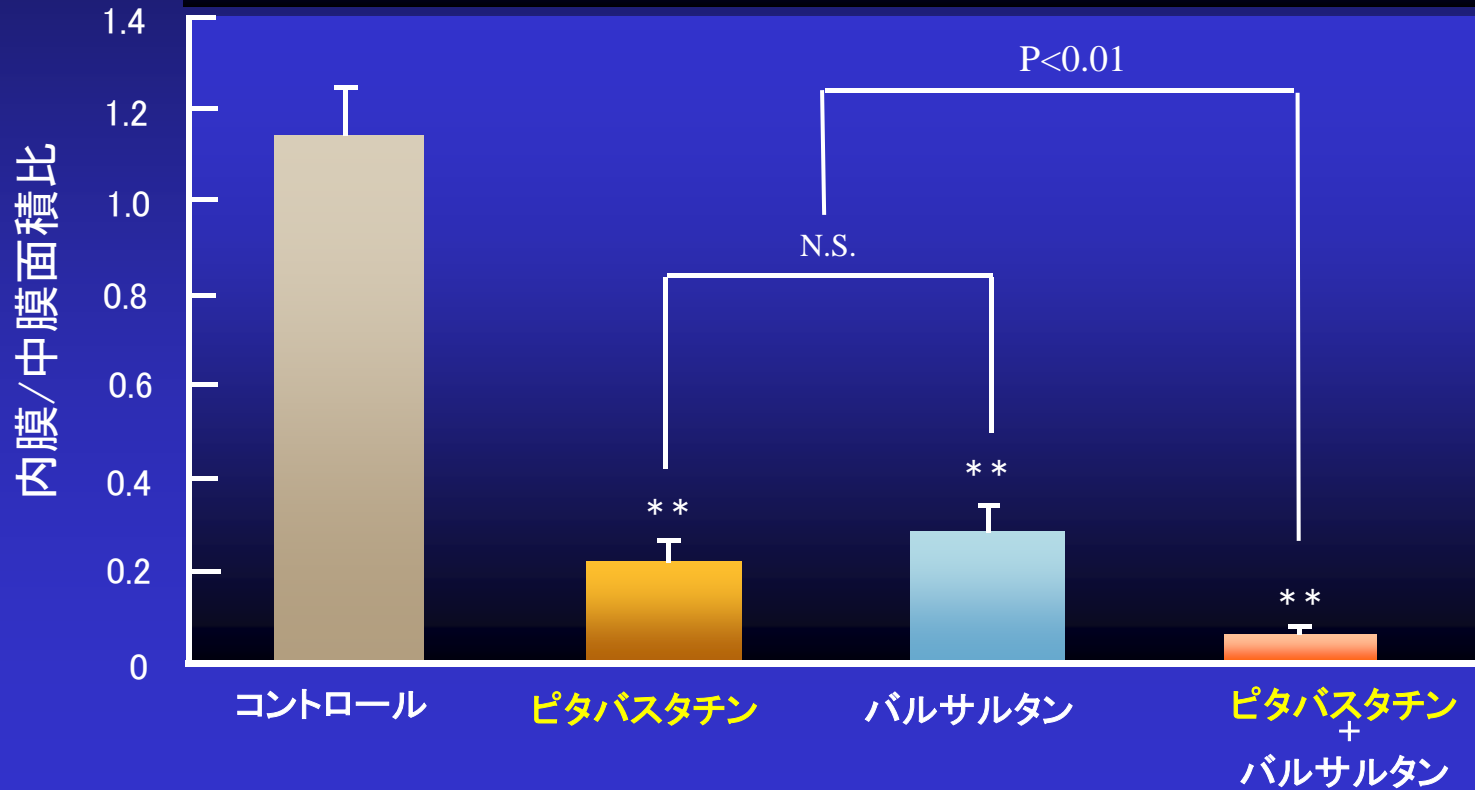

**【Method】** WHHL-MI rabbit, Pitavastatin 0.5mg/kg/day, Valsartan 5mg/kg/day or both for 8 weeks.
