54-yo Female: Acute Inferior Wall STEMI

Distal Emboli, Slow Flow, No Reflow: 15-20%
Microvascular Dysfunction: 30%

5-Year Prognostic Value of No-Reflow Phenomenon After PCI in Pts with AMI

- 1406 pts with STEMI, underwent PCI and had scintigraphic infarct size at 7-14 days
- **Primary Endpoint:** 5-year mortality
- No reflow occurred in 29%
- **Conclusion:**

- In STEMI pts, no-reflow predicts an increased mortality up to 5 yrs
- The no-reflow phenomenon provides prognostic information independent of other relevant clinical factors, including infarct size

55-Year Male Anterior STEMI

Pathophysiology of STEMI:
All patients have thrombus

ILD View | Statistics | Case Explorer

Grayscale IVUS VH IVUS

55-Year Male Anterior STEMI

Value of Virtual Histology in Management of the STEMI Patient

Ruptured plaque

Angiography:

- Underestimates the proximal location of the TCFA and plaque rupture
- Underestimates the volume and length of associated thrombus

Therefore,

- Underutilize aspiration thrombectomy
- Underestimate stent length
- Cause of early complications

Leaky Compression - not intended for diagnosis

Acute Inferior STEMI

AT IVUS & VH Eval

IVUS and VH Imaging of RCA Following AT

IVUS and VH Imaging of RCA Following AT

IVUS and VH Imaging of RCA Following AT

Selective Strategy for Thrombus Management in STEMI (Mehta Strategy)

Thrombus Grade

Mehta Classification

- 0 = No angio evidence** → **Direct stent ± PTCA**
- 1 = Possible thrombus** → **Direct stent ± Pre PTCA**
- 2 = Definite thrombus** → **Aspiration Thrombectomy**
- 3 = Thrombus $> \frac{1}{2}$ but < 2 VD** → **Aspiration Thrombectomy**
- 4 = Thrombus ≥ 2 vessel diam** → **AngioJet**
- 5 = Total occlusion** → **AngioJet**

Catheter Aspiration in STEMI and Different Extent of Coronary Thrombus

191 STEMI pts had AT, followed by direct stenting

	Thrombus Grade 0-1 N = 46	Thrombus Grade 2-5 N = 135	p-value
Reference VD (mm)	3.2 ± 0.4	3.4 ± 0.4	0.004
Successful passage (%)	89	96	0.115
Aspirate obtained (%)	67	90	<0.001
Direct stenting (%)	80	70	0.185
Final TIMI 3 Flow (%)	89	92	0.574
Residual thrombus (%)	0.2 ± 0.8	0.1 ± 0.5	0.294
Distal emboli (%)	2	6	0.536
Early ST-seg resolution (%)	65	70	0.737

Conclusion: Visually observable aspirate obtained in most pts w/ or w/o angio signs of thrombus, extent of thrombus does not influence final result

Routine Thrombectomy: *Utile or Futile?*

- **Thrombus is present in all STEMI patients**
- **Aspiration thrombectomy should be used routinely in all STEMI patients**

Thrombus Aspiration During Primary Percutaneous Intervention in AMI Study (TAPAS)

- 1071 STEMI pts, randomized (before angio) to AT with Export Catheter (533 pts) vs. Std 1° PCI (536 pts)
- **Primary Endpoint:** Myocardial Blush Grade (MBG)
- **MBG 0/1** for **TA** = 17%, for **Control** = 26.3%, $p < 0.001$

TA During Primary PCI Improves Myocardial Reperfusion and Reduces Infarct Size: EXPIRA Trial

- 175 pts randomized to Export PCI vs. Std PCI
- **Primary Endpts:** MBG ≥ 2 , 90-min ST-seg resolution, CE-MRI sub-study in 75 pts with ant. STEMI to assess MO and infarct size

Cardiac Magnetic Resonance Imaging: 3-month F/U

	Std PCI	EM PCI	P-value
Infarct Size (%)	11 \pm 8.7	9 \pm 4.5	0.001
Infarct Size, g	13 \pm 12	11 \pm 8.7	0.004

- **Conclusion:** Manual thrombectomy improves MBG, and STr in pts with visible thrombus. Lowers the rate of MVO and reduces infarct size at 3 months

Impact of Thrombectomy with EXPort Catheter in IRA During Primary PCI (EXPIRA Trial) on Cardiac Death

175 pts randomized, TIMI 0/1 flow, thrombus present

- thrombus score ≥ 3
- All pts received Abxiximab before therapy
- F/U 24 months, Primary endpoints: Death MACE

Adverse Clinical Events at 2 Years

	TA N=88	Std PCI N=87	p-value
MACE	4 (4.5%)	12 (13.6%)	0.038
Cardiac Death	0	6 (6.8%)	0.0001
Reinfarction	0	1 (1.1%)	0.999
TVR	4 (4.5%)	5 (5.7%)	0.651
Stent Thrombosis	0	0	

Independent predictors of death: TA, age, symptom to balloon time

Meta-Analysis of 13 Trials of Manual Thrombectomy: 5 Trials of Mechanical Thrombectomy (AngioJet & X-Sizer)

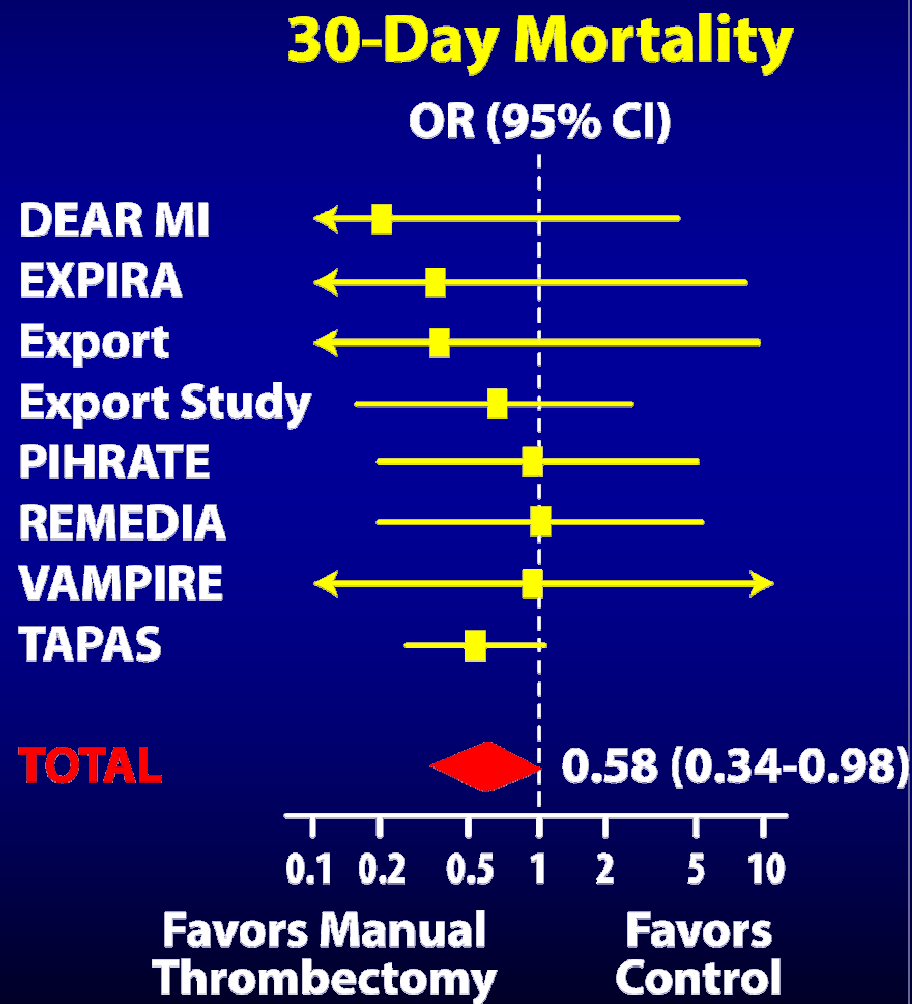

- 9 trials with distal protection (PercuSurge, FilterWire, Spider Rx, Angioguard)

Mortality at 3-6 Months in Primary PCI Patients Comparing Adjunctive Devices for Treatment of Thrombus vs. Control

Adjunctive Manual Thrombectomy Improves Myocardial Perfusion and Mortality in Pts Undergoing Primary PCI for STEMI: A Meta-Analysis of 9 Randomized Trials (N=2417)

	AT	Control	P-value
TIMI-3 Flow (%)	87	81	<0.0001
MBG 3 (%)	52	32	<0.0001
Distal Emboli (%)	7.9	19.5	<0.0001
30-Day Mortality (%)	1.7	3.1	0.04

Routine Thrombectomy: *Utile or Futile?*

Summary of Meta-analyses

- **Use of Aspiration thrombectomy:**
 - **Improves**
 - **TIMI 3 flow post PCI**
 - **ST-segment resolution**
 - **MBG**
 - **Reduces the incidence of**
 - **Distal emboli**
 - **No-reflow (2 meta-analyses reporting)**
 - **Reduces mortality (3 of 4 meta-analyses reporting)**

Routine Thrombectomy: *Utile or Futile?*

Conclusions

- **All STEMI patients have thrombus present**
- **Sequence of management:**
 - 1. Cross with a wire**
 - 2. Aspiration thrombectomy**
 - 3. IVUS**
 - 4. Direct stent**
- **Consider AngioJet only with very large thrombus**

THANK YOU!
