

VSD closure in 2016: An overview

**DO NGUYEN TIN MD.
MEDICAL UNIVERSITY OF HCMC
CHILDREN'S HOSPITAL 1
SAIGON, VIETNAM**

Device closure of VSD

Device closure for VSD, there is

- No data
- No clinical trial
- No consensus
- No evidence
- No protection

Device closure of VSD

But.....

- It's true
- Some experience from centers
- Some case series reports
- Really necessary
- Need: evidence from publication

How?

LV angiography for VSD

Pm VSD

Subaortic VSD

DC VSD

LAO 30°/ CRA 30°

LAO 60°/ CRA 20°

LAO 90°/ 0°

Crossing the defect

Avoiding TV entangling: Control the wire to SVC or PA

VSD closure: step by step

Avoiding TV entangling

VSD closure: step by step

Crossing aortic valve

VSD closure: step by step

Device in LV side

VSD closure: step by step

Release or not?

Checking stability of the device

Who?

INDICATIONS OF VSD CLOSURE

Hemodynamic issues

- **LV dilatation**
- **$Q_p/Q_s > 1.5$**

INDICATIONS OF VSD CLOSURE

MORPHOLOGY ISSUES

- **Can not be closed spontaneously: subpulmonic, muscular, VSD without MSA, residual VSD**
- **DC VSD with the risk of AVP and AR**

INDICATIONS OF VSD CLOSURE

Endocarditis

- **High risk in developing countries**
- **High morbidity and mortality**

INDICATIONS OF VSD CLOSURE

Other special reasons

- **Family's requirement**

- **Patient's requirement**

- **Social issues: study, insurance, working**

PERIMEMBRANOUS VSD

3 main points

- Membranous septal aneurysm
- Distance to aortic valve
- Size of defect

PRESENCE OF ANEURYSM

Without aneurysm:

- Single opening exit in to RV
- ADO I, ADO II, Pfm coil, symmetric or asymmetric VSDO
- **Easy to cross the defect by guide wire or catheter**

Im: 2/77

WITHOUT MSA + SINGLE OPENING EXIT

ADO I, ADO II, PFM coil

PRESENCE OF ANEURYSM

- Some space for the device
- Separating from aortic valve
- Tricuspid valve involvement in to MSA
- Triangle shape: PDA- like: ADO I, ADO II, coil, symmetric, asymmetric...
- Simple or complicated opening exits

WITH ANEURYSM

Some space for the device

ANEURYSM

For complicated aneurysm:
close all in the left side

MULTIPLE OPENING EXITS

Perimembranous VSD- inlet extension type

- TR due to LV to RA shunting
- Septal leaflet of TR is the roof of the defect.

Perimembranous VSD- inlet extension type

- Aneurysm is complicated
- Stability of the aneurysm is unpredictable

Distance from the aortic valve

❖ > 3 mm : many devices can be used: ADO I, PFM COIL, ADO II, AMVSDO, Symmetric

ENOUGH AORTIC RIM

DEFICIENT AORTIC RIM SUB-AORTIC and DOUBLY COMMITTED VSD

- No MSA: no supportive mechanism
- Limited or no aortic rim: should use soft and flexible device: ADO II, Coil
- The severity of aortic valve prolapse and AR

EG)

24138 TREMBLAY LOIC, 2515904,

24138 TREMBLAY LOIC, 2515904,

DEFICIENT AORTIC RIM SUB-AORTIC and DOUBLY COMMITTED VSD

MORPHOLOGY OF DOUBLY COMMITTED

OUTLET VSD

WITH COIL

X1 Distance: 0.50 mm

X2 Distance: 2.51 mm

X2/
X1

OUTLET

VSD

DEFICIENT AORTIC RIM SUB-AORTIC and DOUBLY COMMITTED VSD

MUSCULAR VSD

- **Different morphology**
- **Difficult morphology**
- **More flexible device for tortous defects**
- **More stable for large defects**

MUSCULAR VSD

Outcome?

Main issues in outcomes

- Heart block: AV block
- Aortic valve
- Tricuspid valve
- Residual shunt and hemolysis
- RVOT, LVOT obstruction

Aortic regurgitation in VSD closure

How, when, why?

Aortic regurgitation

- Before procedure: prolapse of RCC
- During procedure: crossing aortic valve
- After procedure: device involvement

Aortic regurgitation

AR before procedure due to prolapse of RCC

Aortic regurgitation

Doubly committed with prolapse of RCC and AR

Acceptable?

Before
procedure

Right after
procedure

2ys after
procedure

Aortic regurgitation

Doubly committed with prolapse of RCC and AR

Acceptable?

Before
procedure

Right after
procedure

6ms after
procedure

2ys after
procedure

Aortic regurgitation

During the procedure: Crossing aortic valve

Aortic regurgitation

Damage of aortic valve

Aortic regurgitation

Device-induced AR

Aortic regurgitation

- Aneurysmal formation: an advantage

The device will lie inside the aneurysm, separate from aortic valve

Tricuspid regurgitation in VSD closure

How, when and why?

Tricuspid regurgitation

- Before procedure: tricuspid valve involvement into aneurysm
- During procedure: entangling
- After procedure: device-induced TR

Tricuspid regurgitation

Before procedure

- Tricuspid valve involvement in aneurysm
- LV – RA shunting

Tricuspid regurgitation

- LV – RA shunting reduced after VSD closure

Before procedure

After procedure

Tricuspid regurgitation

During procedure

- Tricuspid valve entangling

Tricuspid regurgitation

ADO I

Adjusted

After releasing

1 month later

Residual shunt and hemolysis

How, when and why?

Residual shunt and hemolysis

- Residual shunt through the device: high risk of hemolysis
- Residual shunt in Pfm coil: high risk of hemolysis

Residual shunt and hemolysis

Multiple opening exits: no hemolysis

MULTIPLE OPENING EXITS

Heart block in VSD closure

Heart block

- 1 heart block in our cases with AGA
- No heart block with ADO I, ADO II, coil
- Just say NO

Heart block

Softer and more flexible devices: Pfm coil, ADO II, ADO I

Heart block

- With aneurysmal morphology: device will go inside the aneurysm separating from conduction system

Heart block

- Outlet or muscular VSD: far from conduction system

CONCLUSION

- No ideal device, no ideal patient
- Different morphologies can bring different results
- Different devices can bring different results
- Different techniques can bring different results
- If you can prove that the procedure is not really difficult and safe, the indication will be opened
