

Coronary Access After TAVI

Technical Tips and Tricks

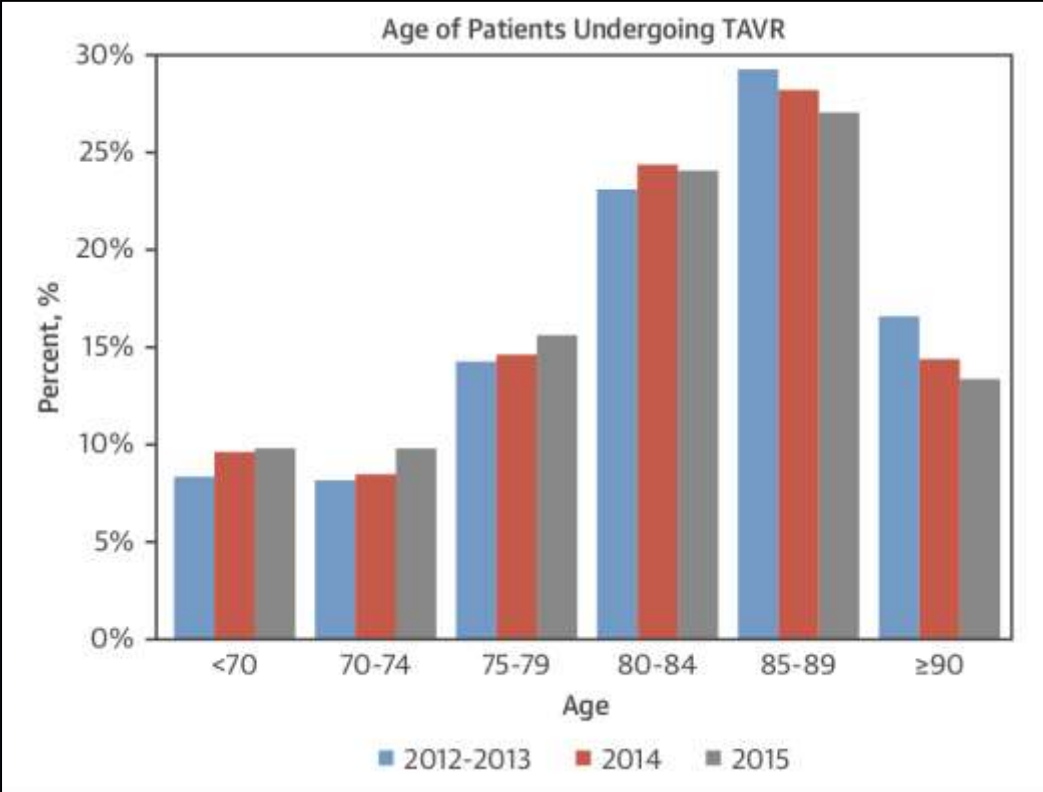

O. Christopher Raffel

Insert Department and Institution Here(20pt)

Prevalence of CAD in the TAVI Patient

Changing Trends in Age at TAVI

Coronary Access After TAVI: Key points

Different from a native AV or a Bioprosthetic AVR

- Large frames that cover the coronary sinus
- Native valve remains between the frame and the coronary sinus
- Less precise than a SAVR – depth, coronary ostia & posts

Small waist of self-expanding TAV – neoaorta

- Catheter choice is different – small curves by 0.5-1.0

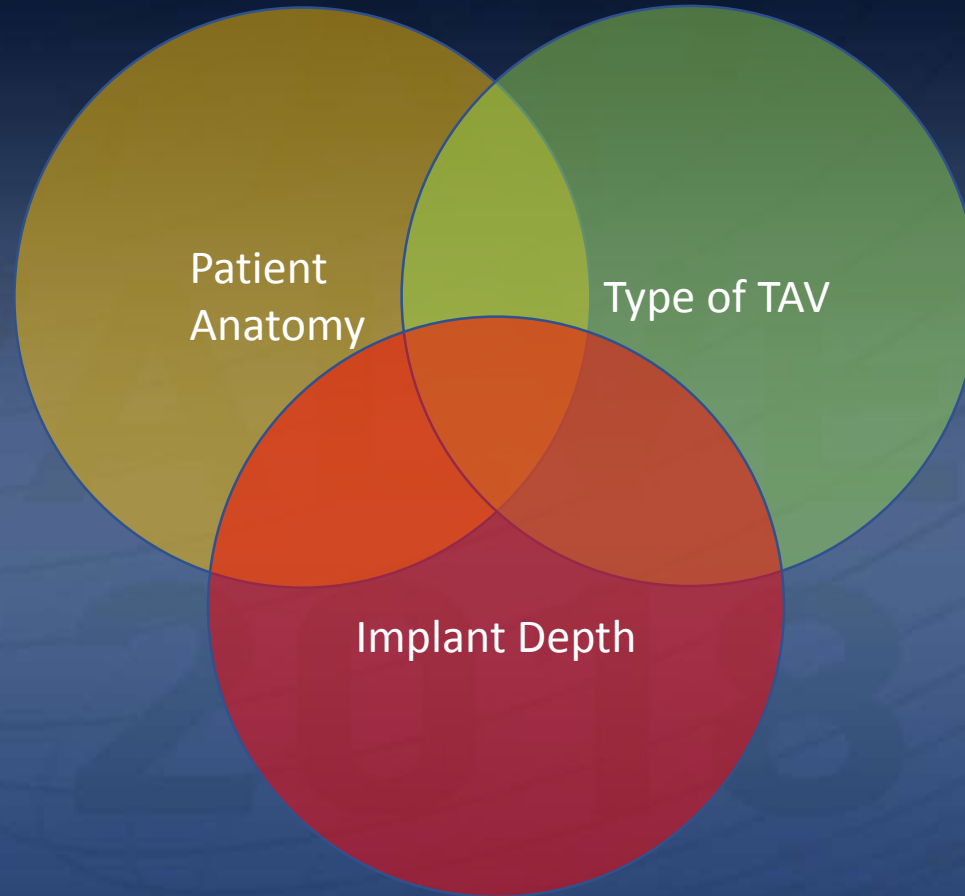

Most times the frame extends above coronary ostia

- Catheter frame interaction – guide going through frame cell
- Use guidewire as rail intubate and extubate ostia across frame

Coaxiality is not always (often is not) possible – **BIGGEST CHALLENGE**

- Free wiring – “fly fishing” wiring – not uncommon
- More frequent use of wire and balloons to rail road guide
- More liberal use of guide extension devices (Guideliner/Guidezilla)
- Use of different guides to Ikari, MPA

Coronary Access After TAVI

Anatomical

1. Sinotubular junction dimensions
2. Sinus height
3. Leaflet length and bulkiness

Coronary Ostia Heights

* All measured from the basal plane

* Gooley et al., JACC Cardiovasc Interv, 2015

* Katsanos et al., Catheterization and CV Interv, doi: 10.1002/ccd.25718

Coronary Access After TAVI

ALL TAV'S MAY EXTEND ABOVE CORONARY OSTIA

- Coronary ostia height measurements are from CoreValve US IDE Trial
- Measurements represent the height from the basal plane to the center of the left coronary ostium
- Yellow box represents the interquartile range (+/- 25%)

Evolut R valve - Size 29

- Annulus Range = 23-26mm
- Depth = 3-5mm

Sapien™*3 - Size 26

- Annulus Range = 23.4-26.4 mm
- Depth = 10% of height

Lotus™** - Size 25

- Annulus Range = 23-25mm
- Depth = 3.6 mm*

Sapien 3 Instructions for Use. http://www.accessdata.fda.gov/cdrh_docs/pdf14/P140031c.pdf

Device and Procedural

1. Commissural tab orientation
2. Sealing skirt height
3. Valve implant depth

Device and Procedural

1. Commissural tab orientation
2. Sealing skirt height
3. Valve implant depth

Device and Procedural

1. Commissural tab orientation
2. Sealing skirt height
3. Valve implant depth

CoreValve: Skirt Height

	23mm Evolut R / PRO	26 mm Evolut R / PRO	29mm Evolut R / PRO	34mm Evolut R
A. Inflow Diameter	23 mm	26 mm	29 mm	34 mm
B. Waist Diameter	20 mm	22 mm	23 mm	24 mm
C. Outflow Diameter	34 mm	32 mm	34 mm	38 mm
D. Frame height	45 mm	45 mm	45 mm	46 mm
E. Commissure Height	26 mm	26 mm	26 mm	26 mm
F. Skirt Height	13 mm	13 mm	13 mm	14 mm

CoreValve: Commissure Height

	23mm Evolut R / PRO	26 mm Evolut R / PRO	29mm Evolut R / PRO	34mm Evolut R
A. Inflow Diameter	23 mm	26 mm	29 mm	34 mm
B. Waist Diameter	20 mm	22 mm	23 mm	24 mm
C. Outflow Diameter	34 mm	32 mm	34 mm	38 mm
D. Frame height	45 mm	45 mm	45 mm	46 mm
E. Commissure Height	26 mm	26 mm	26 mm	26 mm
F. Skirt Height	13 mm	13 mm	13 mm	14 mm

CoreValve: Waist Diameter – “neo aorta”

	23mm Evolut R / PRO	26 mm Evolut R / PRO	29mm Evolut R / PRO	34mm Evolut R
A. Inflow Diameter	23 mm	26 mm	29 mm	34 mm
B. Waist Diameter	20 mm	22 mm	23 mm	24 mm
C. Outflow Diameter	34 mm	32 mm	34 mm	38 mm
D. Frame height	45 mm	45 mm	45 mm	46 mm
E. Commissure Height	26 mm	26 mm	26 mm	26 mm
F. Skirt Height	13 mm	13 mm	13 mm	14 mm

Waist Diameter

- Narrow “Neo-aorta”
- Smaller curve catheters/guides
- Contralateral backup support

Coronary Access Depending on Implantation Depth

FIGURE 2 Self-Expanding Valve and Coronary Access Depending on Level of Implantation Across the Annulus

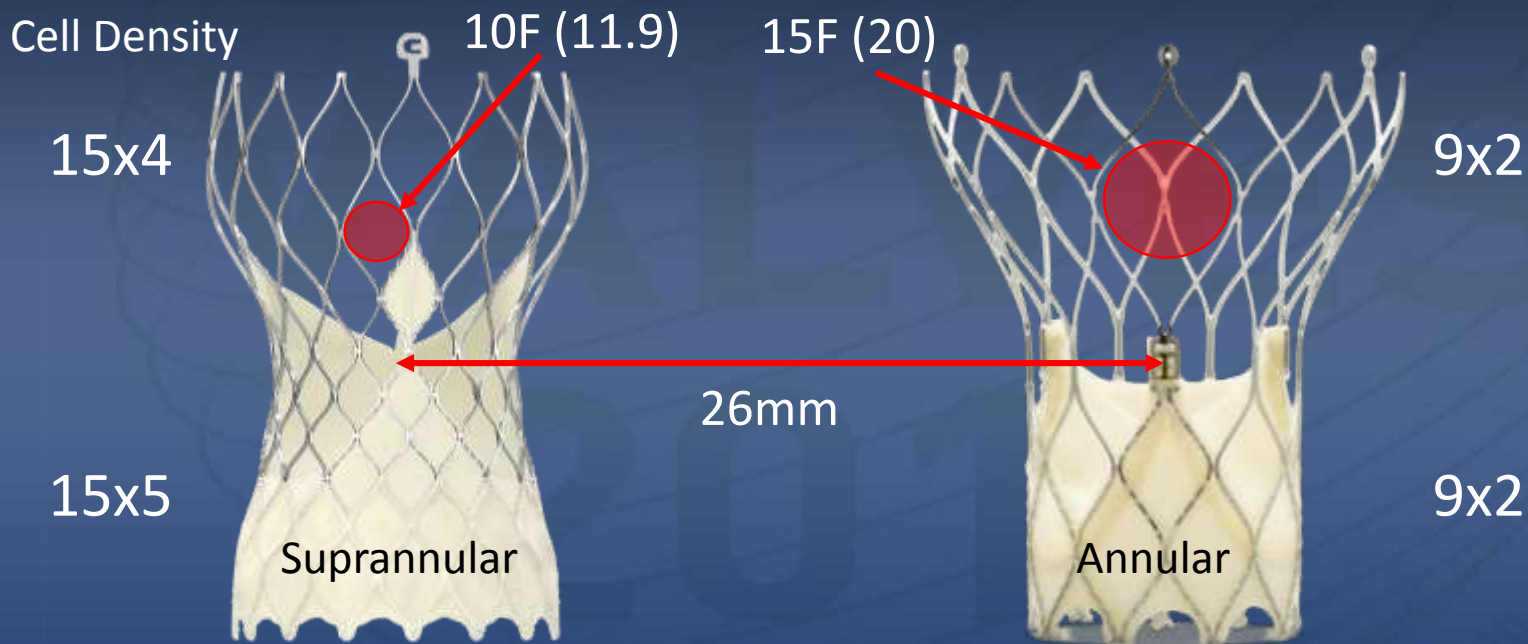

Particularly with low-coronary height $\leq 10\text{mm}$ implant depth of at least $\sim 4\text{mm}$ is important.

Coronary Access Depending Position of Commissural Post

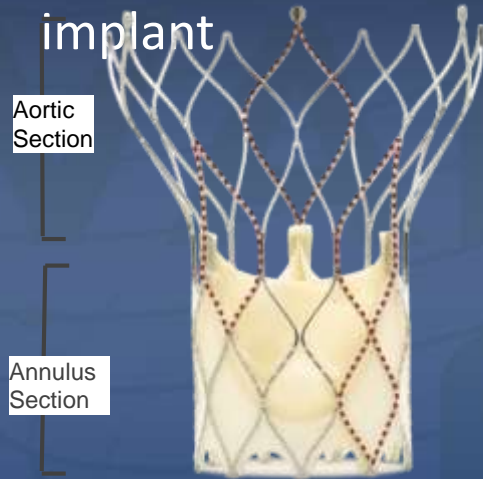

CoreValve vs Portico

Portico: Large cell design

- Large stent cells in the aortic section of the stent, allows access to coronary ostia post-implant

Manoharan, G., St. Jude Medical Portico™ Transcatheter Aortic Valve Clinical Experience, EuroPCR, 05/17/2012.

CoreValve: Angio + PCI

1. Use aortography to confirm ostia takeoff points and positioning of the Evolut R prosthesis by using a pigtail catheter

- Assess implant height, and anatomical and device specific features.
- Count 4-5 alternating diamonds on the valve to identify access point above the sealing skirt
 - 2.5 diamonds = top of sealing skirt
 - 5 diamonds = top of commissure point

Coronary Angiography and PCI after TAVR with CoreValve

Initial non-selective injection followed by selective

- Facilitated by using J-wire to enter diamond in-front/adjacent to ostia (angled stiff glide wire useful too for entering diamond or tracking the catheter)

CoreValve

2. Engage the coronary ostium coaxially through the middle of the frame cell:
 1. Target the valve frame cell that is co-axial to the coronary ostia
 2. Always try and take the catheter tip into the frame cell over the guide wire. ALWAYS remove guide over guide wire.
 3. If there is difficulty with the frame cell that is directly coaxial to the ostium, use the frame cell to the left or right or above the ostium
 4. May need to “fly-fish” the guidewire and rail guide in.

Coronary PCI after CoreValve TAVI

Left Coronary

- Use JL3.5/3.0, EBU 3.0. JR4 if small neo aorta and sinus.
- Second line guide: Ikari right 1.0 or IkR 1.5
- If difficulty with coronary engagement, rail guide using:
 - Coronary guidewire \pm
 - Balloon support \pm
 - Guide extension catheter

Right Coronary

- Use JR4 guide
- Second line guide: Ikari Right 1.5, AR (wide sinuses), MP
- If skirt is high, use Ikari Right or MPA guide to enter diamond from above coronary ostia and rail guide towards ostium

Coronary PCI after Sapien

Left Coronary

- Standard diagnostic & guide
Catheters: JL4, EBU/VL 3.5 or 4

If Commissural post in front of Ostium

- Use adjacent cell or come from above frame
- Rail guide using: Guide wire/Balloon/Guide Extension

If high implant +/- bulky native leaflets

- Pre-wire and rail guide.
- May need double wire support/semi selective engaged guide for PCI.

Right Coronary

- Standard catheters: JR4, IM, AR

LCA diagnostic with JL4

ROTA-PCI of Cx . EBU 3.5 guide

Guide extension with Guideliner to cross the frame cell

Guide extensions – balloon assisted tracking

Guide extensions – balloon assisted tracking

In Summary

- PCI post TAVI will become more common
- Generally high success rate
- Important to understand the characteristics of the TAVI device and how it is interacting in the specific patient (patient anatomy & deployment characteristics)
- Catheter selection 0.5 size smaller curve for long stent self-expanding TAV. More liberal use of wire & balloon tracking and guide extension devices.

Coronary Access & PCI After TAVI

- Anatomical factors
- TAV type
- Implant depth

Anatomical

1. Sinotubular junction dimensions
2. Sinus height
3. Leaflet length and bulkiness
4. Sinus of Valsalva width
5. Coronary height

CoreValve vs Portico

SJM Portico Comparison

Medtronic CoreValve

SJM Portico

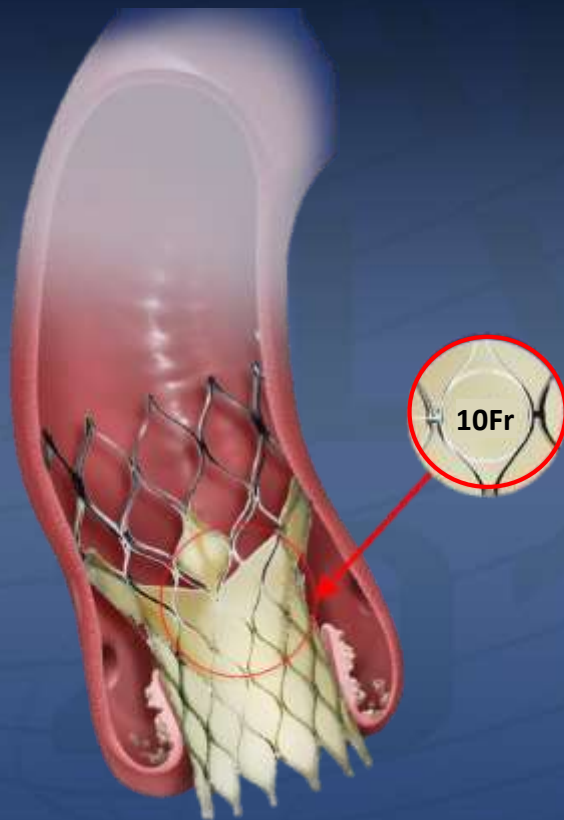

CAD in TAVI: Background

- High prevalence in TAVI population.
- AUC suggests pre-TAVI revascularization appropriate; but not universally practiced.
- Post TAVI coronary intervention uncommon but likely to increase in incidence.
- Provide some challenges unique to TAVI; variable implant height, presence of native valve, self-expanding TAV frame.

Coronary Access After TAVI

- Anatomical factors
- TAV type
- Implant depth

CoreValve: Cell Geometry

Coronary Access

- Cell geometry preserves coronary access
- Will allow 8F guides (10F)
- However, with angulation and space between frame and root guide – frame interaction occurs. Insert & remove over guidewire.

	Kerckhoff-Klinik	Segeberg Registry	UK Registry	TAVR-LM Registry
Incidence	35 / 1,000 (3.5%)	17 / 296 (5.7%)	18 / 2,588 (0.7%)	9 / 6,405 (0.1%)
ACS Indication	11.4%	37.5%	65%	78%
Time to Intervention Post-TAVR	233 ± 158 days	17.7 months (range: 1-72)	136 days (range: 1-1092)	368 days (IQR: 204-534)
