**Individualized Decision Making between Percutaneous and Surgical  
Revascularization in Patients with Complex Coronary Artery Disease:  
Redevelopment and Validation of the SYNTAX score II 2020**

**In press in the LANCET**

# BACKGROUND

- **RCT 's are the gold standard** for testing the effectiveness of novel treatment .
- **Average treatment effect** are typically reported in RCT's
- However, **treatment effectiveness can vary across individual patients.**
- **Average treatment effect may be suboptimal** for decision-making in **individual patients**<sup>1,2..</sup>
- The **SYNTAX score II (2013)** derived from 2 angiographic and 6 clinical variables, provides an **individualized decision-making based on 4-year all-cause death** after either CABG or PCI <sup>3</sup>.
- Using the data of the 10 years F/uP of **SYNTAX Extended Survival (SYNTAXES)** <sup>4</sup>, we sought to :
  - (i) **update the SS II ( version 2020)** for prediction of **10-year Mortality** and **5-year MACCE**
  - (ii) to **externally validate ( FREEDOM,BEST,PRE-COMBAT)** the SS II 2020 for its ability to predict treatment benefit in **mortality** and in **MACCE**.

# Average Treatment Effect as a Summary Result for 10-year All-cause Death in the SYNTAXES

HR 1.19, 95% CI (0.99-1.43),  $P = 0.066$

**CABG**  
**PCI-TAXUS**

Based on the average treatment effect,  
should you send all your patients to surgery?

The answer is of course :no!

**28.4%**

**24.5%**

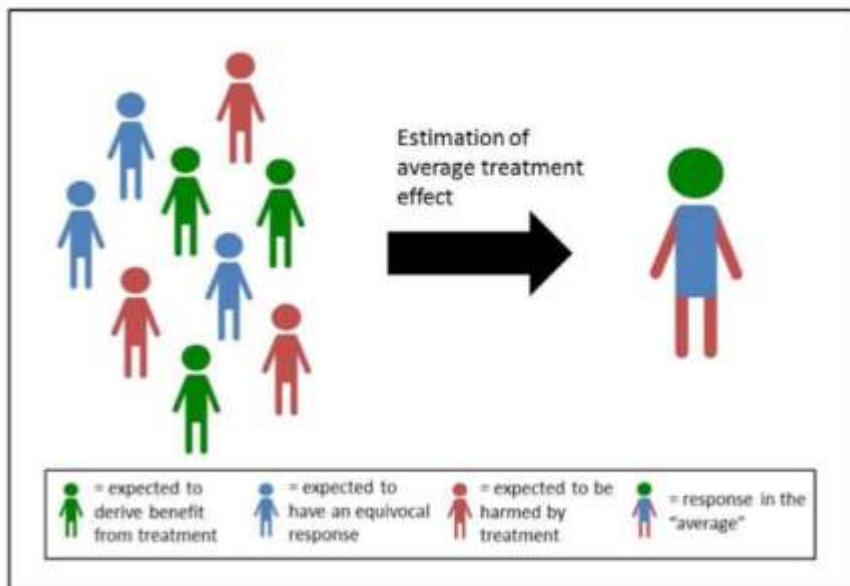

Numbers at risk

	0	1	2	3	4	5	6	7	8	9	10
PCI	903	860	844	822	795	744	699	680	651	621	583
CABG	897	856	838	820	799	753	711	687	666	644	620

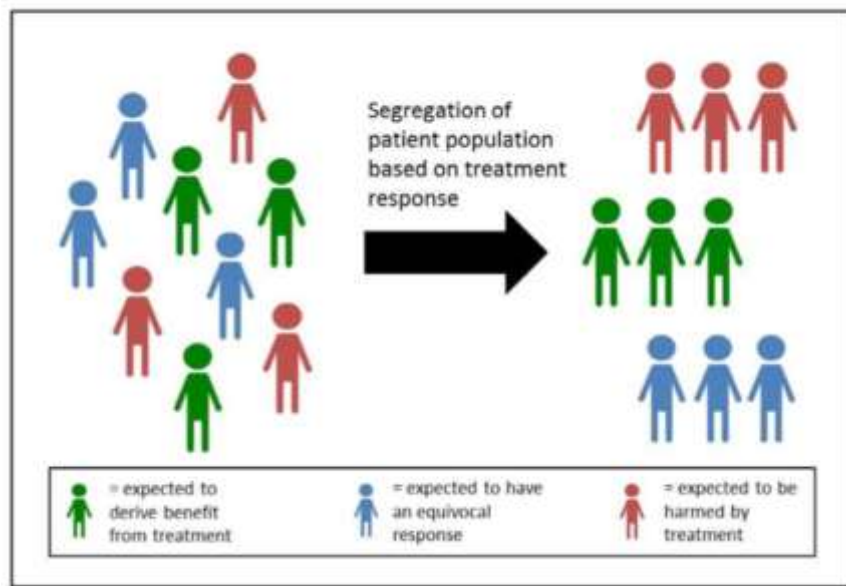

# Decision Tools to Improve Personalized Care in Cardiovascular Disease

Moving the Art of Medicine Toward Science

**A** Average Treatment Effect Assessed in a Heterogeneous Population

**B** Identification of Heterogeneous Responses to Treatment

# SYNTAX Score II (2013)

SYNTAX Score II was developed by applying a **Cox proportional hazards model** to the 4-year results of SYNTAX trial resulting in a combination of 6 clinical and 2 anatomical independent **predictors of 4 years all-cause mortality**:

Anatomical  
SYNTAX Score

LMCAD

Age

Cr Clearance

LVEF

Female

PVD

COPD

At four year F/uP , females randomized to CABG had a lower all-cause mortality than females randomized to PCI

At ten years all cause mortality rates in females (PCI or CABG )were identical.

In male (PCI vs CABG) all cause mortality started to diverge after 7 years

# SYNTAX Score II 2020

SYNTAX Score II 2020 was redeveloped to predict **10-year mortality** and **5-year MACE** in the SYNTAX(ES) trial and externally validated in the FREEDOM, BEST, and PRECOMBAT trials:

Anatomical  
SYNTAX Score

Disease type  
(3VD or LMCAD)

Current smoking

Age

Cr Clearance

LVEF

Diabetes

PVD

COPD

$$\text{Pr (10-year mortality)} = 1 - \exp(-0.243 * \exp(0.99 * (0.72 * \text{Age}/10 - 0.07 * \min(\text{CrCl}, 90)/10 - 0.31 * \text{Min}(\text{LVEF}, 50)/10 + 0.48 * \text{COPD} + 0.73 * \text{PVD} + 0.20 * \text{Medically treated diabetes} + 0.46 * \text{on insulin} + 0.66 * \text{Current smoking}) - 0.10 * \text{LMCAD} - 0.40 * \text{CABG} * 3\text{VD} + 0.02 * \text{CABG} * \text{LMCAD} + 0.16 * \text{PCI} * (\text{SYNTAX Score} - 29)/10 - 2.80)).$$

# SYNTAX Score II 2020

SYNTAX Score II 2020 was redeveloped to predict **10-year mortality** and **5-year MACE** in the SYNTAX(ES) trial and externally validated in the FREEDOM, BEST, and PRECOMBAT trials:

Anatomical  
SYNTAX Score

Disease type  
(3VD or LMCAD)

Current smoking

Age

Cr Clearance

LVEF

Diabetes

PVD

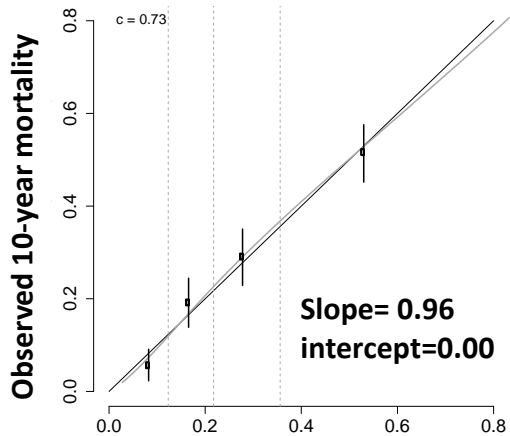

COPD

**Pr (5-year MACE)** =  $1 - \exp(-0.175 * \exp(0.74 * (0.72 * \text{Age}/10 - 0.07 * \min(\text{CrCl}, 90)/10 - 0.31 * \min(\text{LVEF}, 50)/10 + 0.48 * \text{COPD} + 0.73 * \text{PVD} + 0.2 * \text{Medically treated diabetes} + 0.46 * \text{On insulin} + 0.66 * \text{Current smoking}) - 0.23 * \text{LMCAD} - 0.48 * \text{CABG} * 3\text{VD} + 0.13 * \text{CABG} * \text{LMCAD} + 0.19 * \text{PCI} * (\text{SYNTAX Score} - 29)/10 - 2.00))$ .

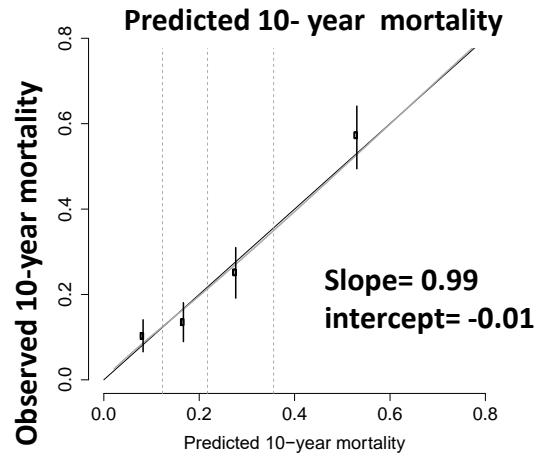

# Cross validation of the 10 years mortality in the SYNTAXES ( 1800 patients)

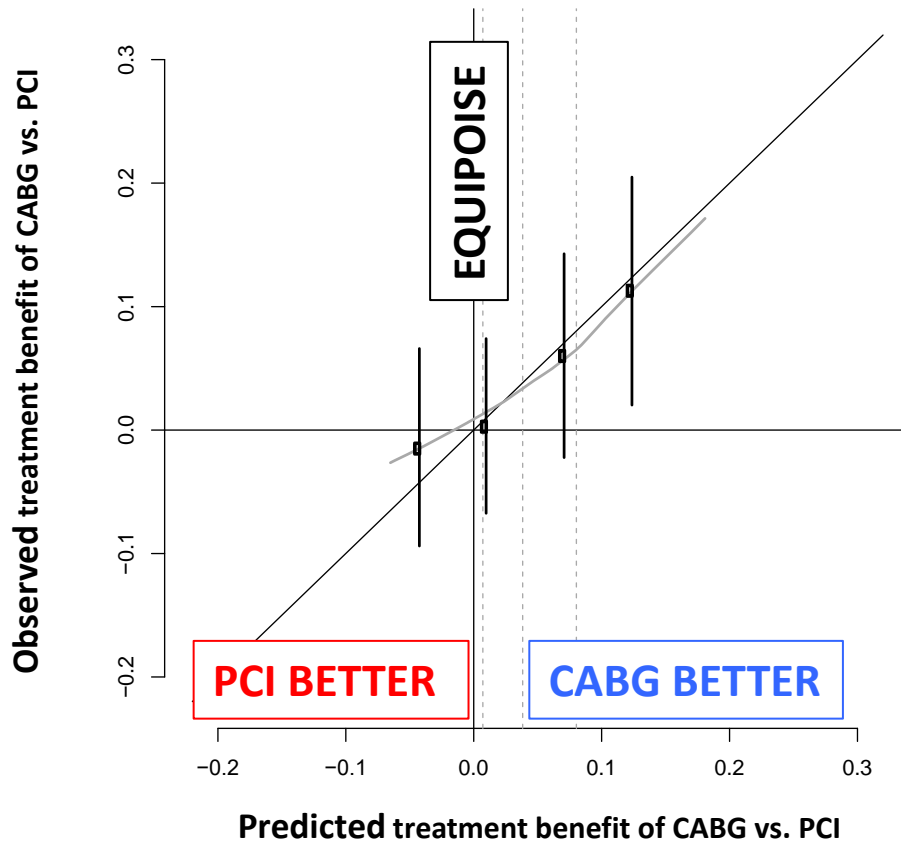

PCI

CABG

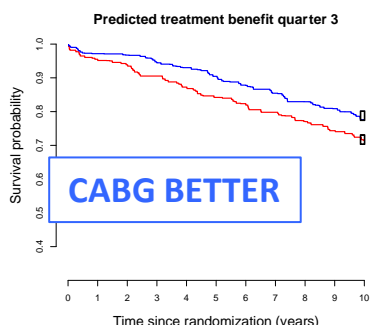

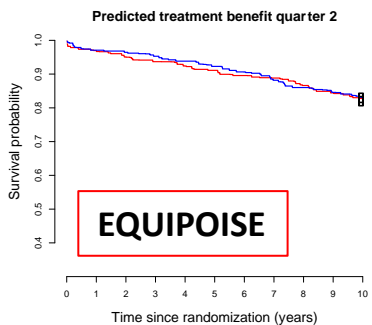

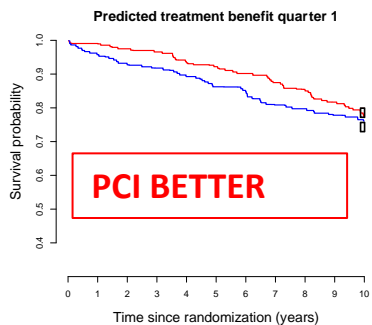

Difference in 10-year mortality called  
"Treatment benefit" of CABG vs. PCI for mortality

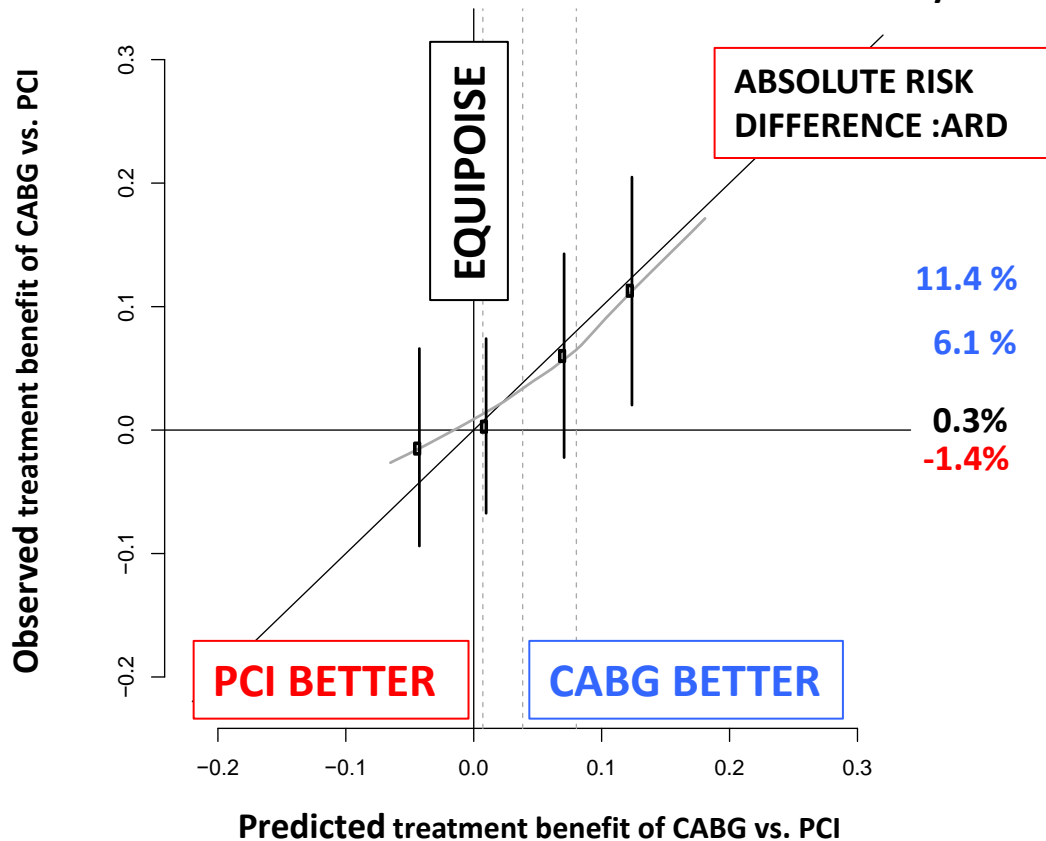

# Cross validation of the 10 years mortality in the SYNTAXES ( 1800 patients)

## Kaplan-Meier curves by quartiles

- Predicted risk of 10-year mortality with PCI
- Predicted risk of 10-year mortality with CABG

Difference in 10-year mortality called  
 "Treatment benefit" of CABG vs. PCI for mortality

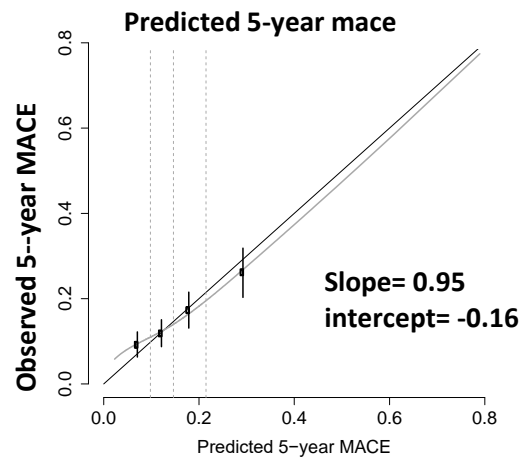

# External Validation of the 5-year MACE model in the FREEDOM, BEST, and PRECOMBAT trials (n= 3,380 patients)

PCI

CABG

Difference in 5-year MACCE called  
“Treatment benefit” of CABG vs. PCI for rMACCE

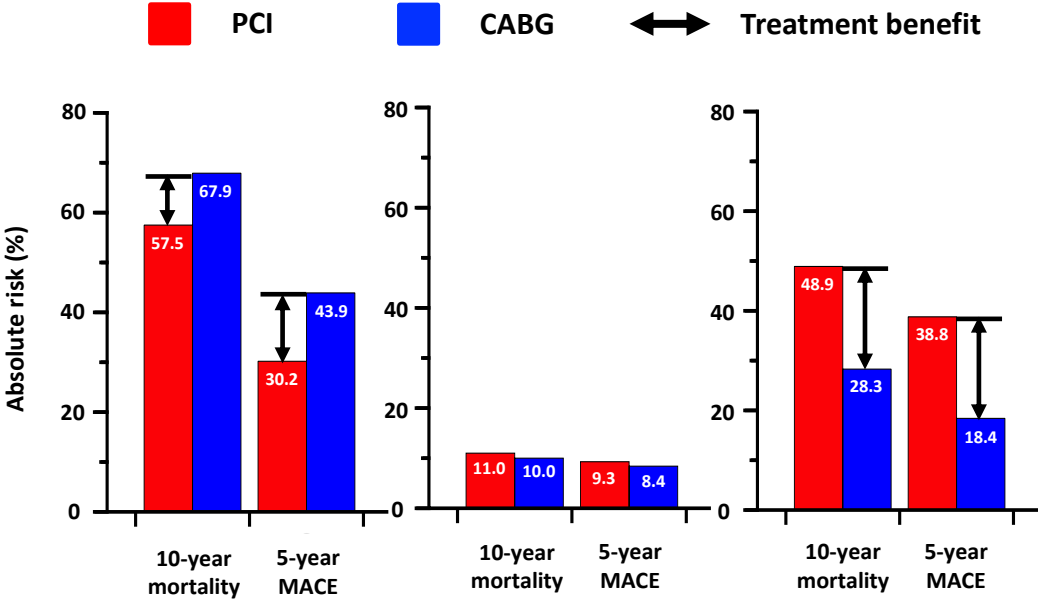

# SYNTAX Score II 2020 for Individualized Decision Making

Baseline characteristics at the time of decision-making	<i>Case 1</i>	<i>Case 2</i>	<i>Case 3</i>
Age (years):	74	59	69
Diabetes:	-	Yes	Yes
On insulin:	-	-	Yes
CrCl (ml/min/1.73m <sup>2</sup> ):	38.6	67.6	72.5
LVEF (%):	40	67	55
COPD:	-	-	-
PVD:	-	-	-
Current smoking:	Yes	-	-
3VD or LMCAD:	LMCAD	3VD	3VD
Anatomical SYNTAX score:	11	10	50

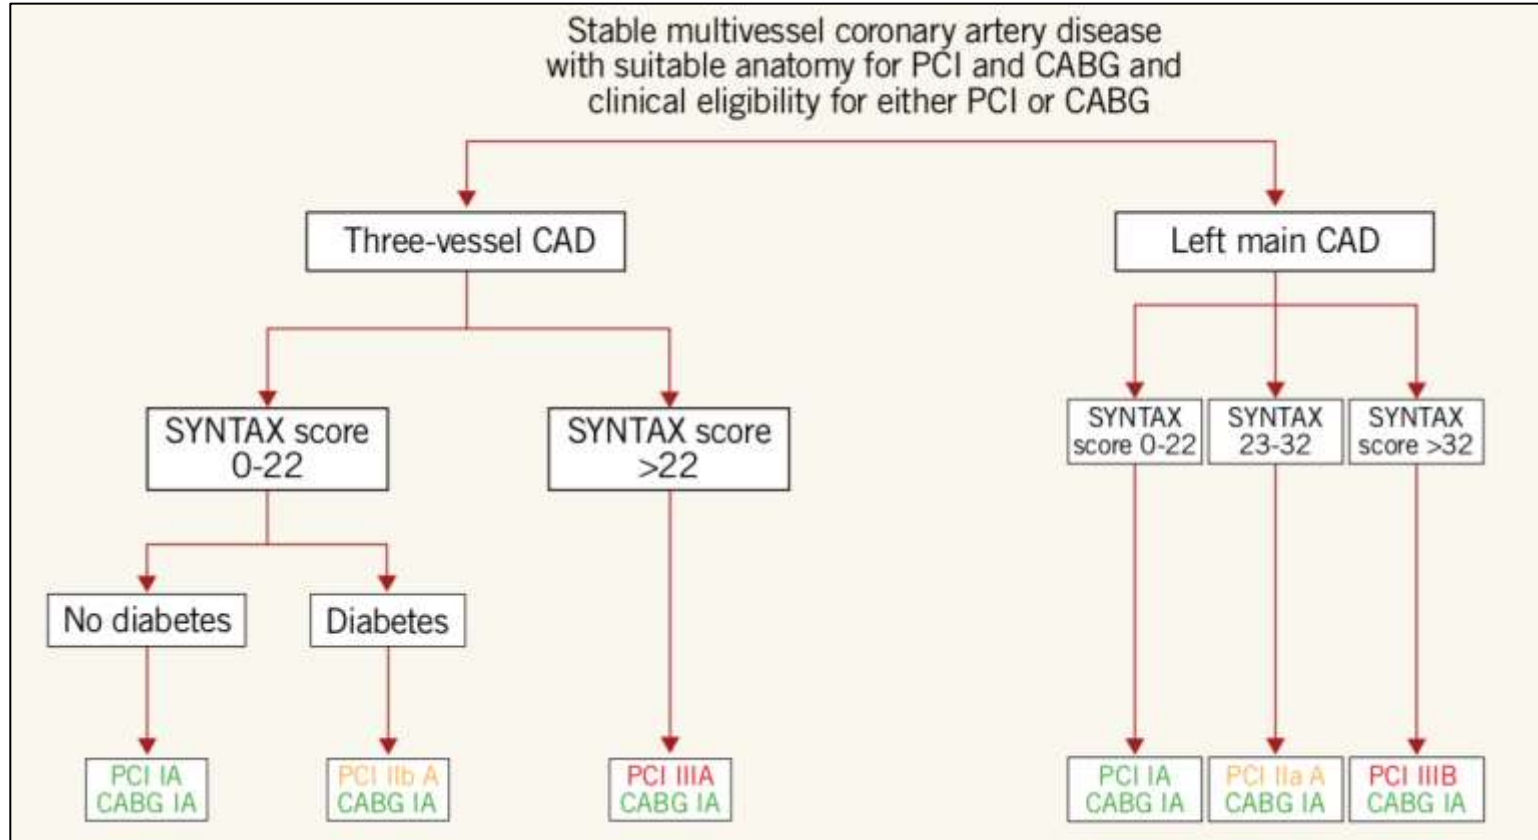

# Conclusions

- Using data from the randomized **SYNTAX(ES) trial**, we have updated and externally validated the SS II 2020, a personalized predictive model based on 7 prognostic factors and 2 pre-specified effect modifiers \_disease type (3VD or LMCAD) and\_ the anatomical SS to predict **10-year all-cause death** and 5-year **MACE** for patients treated with either PCI or CABG.
- By providing expected **probabilities of 5- and 10-year outcomes**, this model may improve the ability of the Heart Team to inform patients and their families regarding the risks and benefits of alternative treatments for complex CAD and support **a more transparent shared decision-making process**.

# Limitations

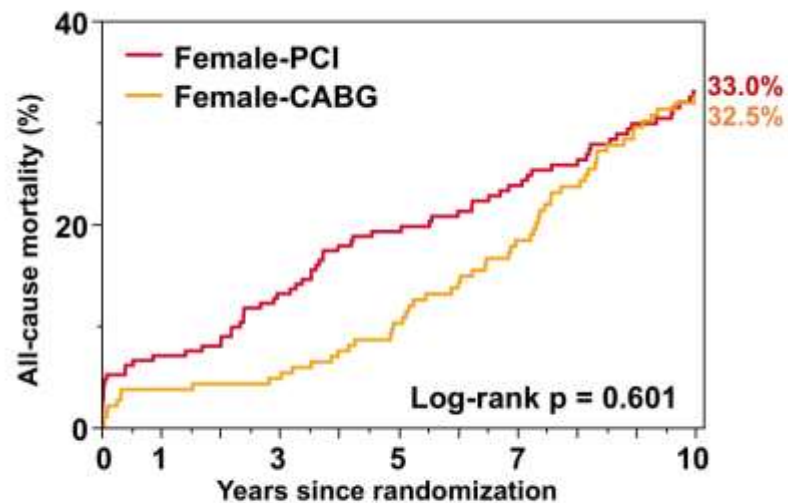

- The **SYNTAX** trial was conducted between 2005 and 2007 with a default use of the **first-generation DES** for treatment with PCI, whereas the newer generation DES may improve outcomes. However, it is unavoidable that the findings from **long-term follow-up data** are inherently based on **somewhat outdated** technology and method of treatment, whereas evidence derived from implementation of **contemporary technology** and best practice can be derived only from **short-term follow-up studies**.
- The **SYNTAXES** study evaluated **vital status up to 10 years** and did not assess other outcomes, and thus a **prediction model for MACE beyond 5 years** could not be constructed.

# Algorithm to guide the choice of revascularization procedure across major categories in patients with 3VD or LMCAD
