ISR (In-Stent Restenosis)

What causes restenosis in stents?

Neointimal hyperplasia Mainly smooth muscle cell proliferation

Newly formed atherosclerotic changes within the neo-intima

Stent malapposition

Stent underexpansion

Intimal hyperplasia

EEM area = 12.84 Stent area = 7.05 MLA = 2.79

IH = 60.4%

 \Rightarrow ISR d/t Intimal hyperplasia

Stent under-expansion

EEM area = 11.94 Stent area = 4.35 MLA = 2.56

IH = 41%

 \Rightarrow ISR d/t Stent under-expansion

Stent under-expansion

https://onlinelibrary.wiley.com/doi/full/10.1002/ccd.28641

Stent malaposition

Plaque modification

Benefits of Plaque Modification

- Changes compliance in resistant lesions
- Helps minimize vessel trauma

 Reduces plaque burden and/or minimizes plaque shift

IRIS-DES, 3-year Target-vessel failure (cardiac death, target vessel MI, ischemic driven TVR)

COLLEGE MEDICINE

CardioVascular Research Foundatio

Calcification results in *Suboptimal Stent Results*

✓ Impaired stent delivery

✓ Decreased stent expansion

✓ Malapposition

✓ Stent asymmetry

Complications: dissection, perforations

Impact of Angiographic Result After Predilatation on Outcome After Drug-Coated Balloon Treatment of In-Stent Coronary Restenosis

Akihito Tanaka, MD^{a,b}, Azeem Latib, MD^{a,b}, Richard J. Jabbour, MD^{a,b,c}, Hiroyoshi Kawamoto, MD^{a,b}, Francesco Giannini, MD^b, Marco Ancona, MD^b, Damiano Regazzoli, MD^b, Antonio Mangieri, MD^b, Roberto Mattioli, MD^d, Alaide Chieffo, MD^b, Mauro Carlino, MD^b, Matteo Montorfano, MD^b, and Antonio Colombo, MD^{a,b,as}

"Adequate" group

- <u>Retrospective analysis of ISRs treated by DCB</u>
- <u>Classified as "Adequate" or "Inadequate" based on pre-dilation results:</u>
- <u>"Adequate" (N=98): TIMI 3, %DS ≤30%, NO major dissections</u>
- "Inadequate (N=68): TIMI <3 or %DS >30% or major dissections

Lesson learned from DCB pre-dilatation in ISR Suboptimal angiographic result of pre-dilation before DCB predicts TLR

General Principle of DCB-only Strategy

Alfonso F., SchellerB. EuroIntervention2017;13:680-695

HOW TO TREAT ISR?

CENTRAL ILLUSTRATION: Efficacy and Safety of Drug-Coated Balloon Angioplasty and Drug-Eluting Stent Implantation According to In-Stent Restenosis Type

In DES ISR, DEB is the first option, and in BMS ISR, DES is a good choice.

Giacoppo, D. et al. J Am Coll Cardiol. 2020;75(21):2664-78.

Case I: Patient information

Brief Case Summary

<u>A 67-year-old female with diabetes was admitted for effort chest</u> <u>pain and referred for abnormal results of coronary CT. Her CT at</u> <u>an external hospital demonstrated a severe stenosis at the mLAD</u> <u>and diffuse moderate stenosis at the 1st DI_Ostium</u>

- The reason for underexpansion is that the calcified plague was not pre-modification

- If we put a stent without pre-modification, it is difficult to do the procedure later.

- We should optimize the stent using the IPSP method as an image guid

Case II : Patient information

Brief Case Summary

A 74-year-old female with diabetes was admitted for effort chest pain and referred for abnormal results of coronary CT. Her CT at an external hospital demonstrated a severe stenosis at the RCA and diffuse moderate stenosis at the LCX

Conclusion

- There are many causes of ISR ; under-expansion
- To understanding cause of ISR; must be need image (IVUS, OCT)
- Severe Under expansion ISR is usually caused by not doing any premodification or image guided.
- Through the image, we should select a device that fits the vessel size and actively expand it
- Image guided PSP can improve the patient's outcome and prevent ISR.
