## 12-month Primary Patency (SFA only)

## 12-month Major Adverse Events

## DEBELLUM trial

Randomized, 50 Patients  
122 lesions (SFA and BTK):

- Significantly ↓LLL and ↑Primary Patency vs. PTA at 6 and 12 months in SFA
- Stents do not compromise DEB outcomes

**IN.PACT SFA Randomized Trial** of  
**IN.PACT Admiral DCB vs. PTA** for the  
**Treatment of Atherosclerotic Lesions in the**  
**SFA and/or PPA 1-year Primary Outcomes**

# IN.PACT SFA Trial Overview

## IN.PACT Admiral DCB vs. standard PTA for the treatment of superficial femoral and proximal popliteal artery disease due to claudication and rest pain

- Prospective, multicenter EU and US, randomized (2:1), single blinded
- Independent and blinded Duplex Ultrasound Core Lab <sup>[1]</sup>, Angiographic Core Lab <sup>[2]</sup>, and Clinical Events Committee <sup>[3]</sup>
- Independent Data Safety Monitoring Board <sup>[3]</sup>
- External monitoring with 100% source data verification
- Subjects followed up to 5 years

1. VasCore DUS Core Laboratory, Boston, MA, US

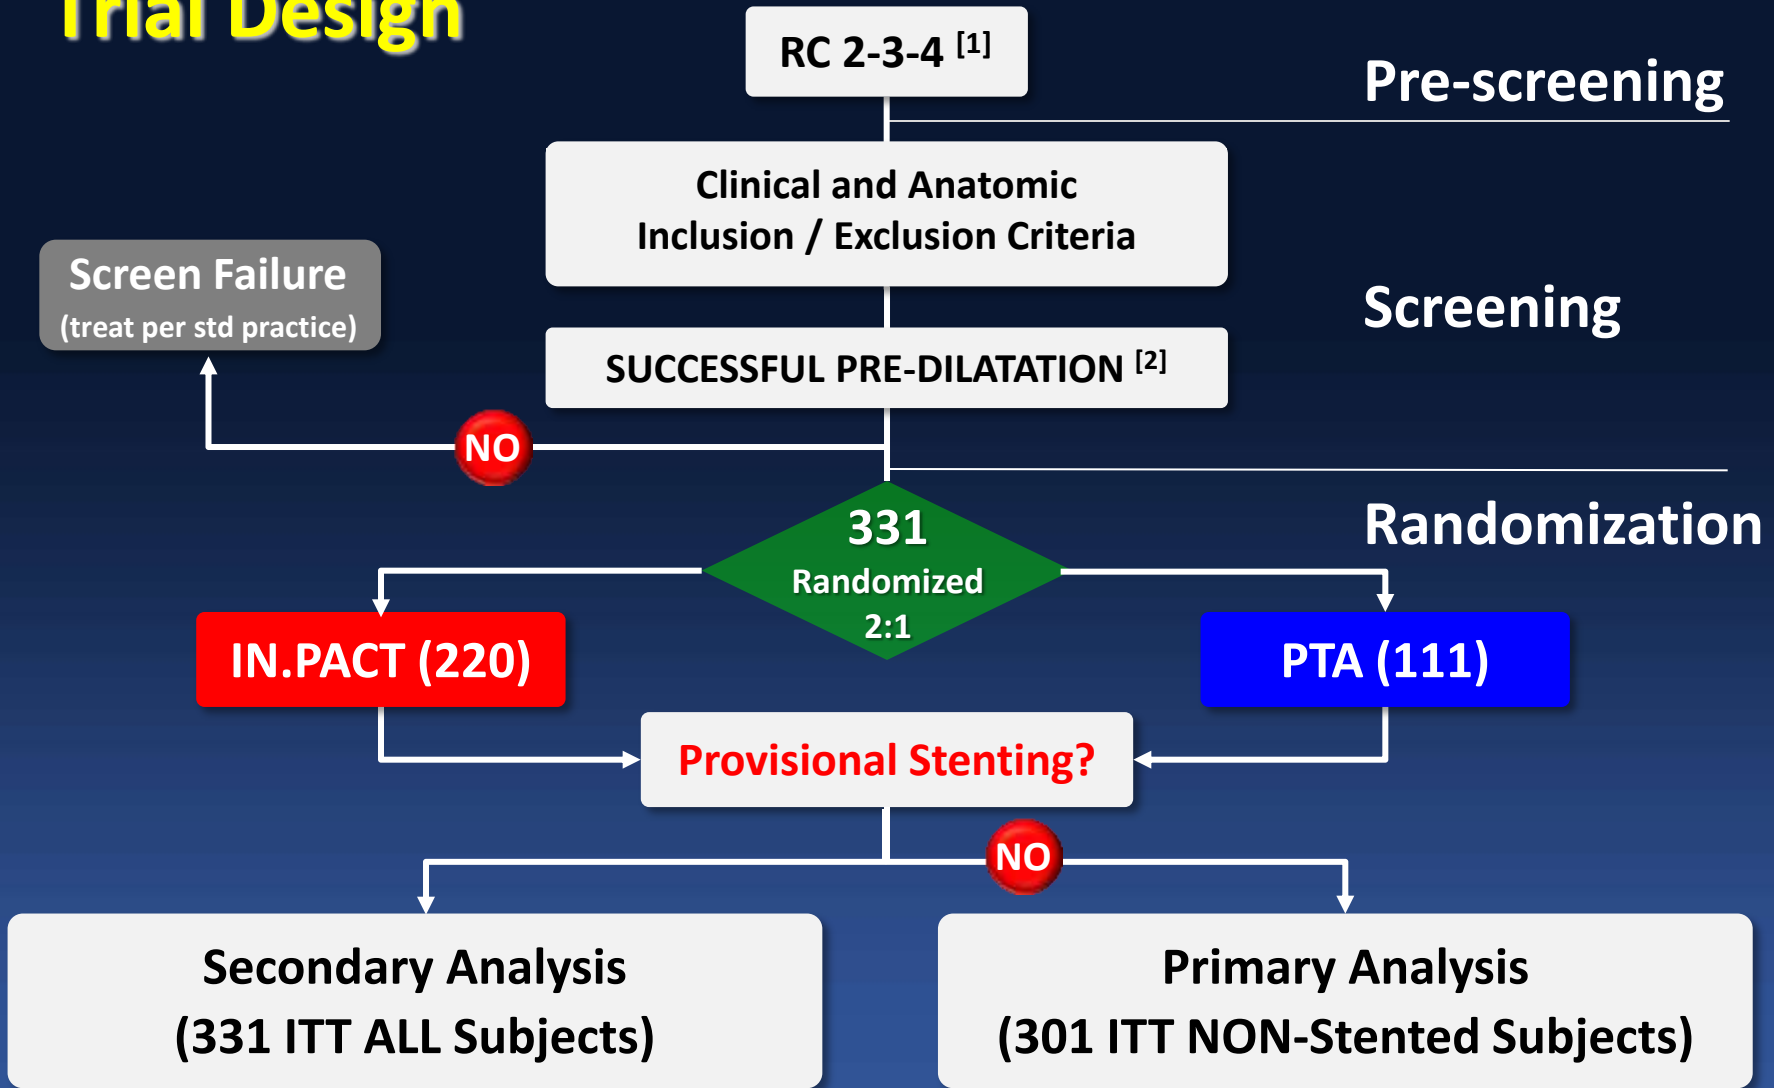

2. SynvaCor Angiographic Core Laboratory, Springfield, IL, US

3. Clinical Events Committee and Data Safety Monitoring services provided by HCRI, Boston, MA, US

# Rigorous Unbiased Assessment

- **Restenosis** assessed either by DUS Core Lab (PSVR  $>2.4$ ) or Angiographic Core Lab ( $>50\%$  DS)
- **Clinically-driven TLR** based on any re-intervention at the target lesion due to symptoms or drop of ABI of  $\geq 20\%$  or  $>0.15$  when compared to post-procedure baseline ABI
- **Clinically-driven TVR** based on any re-intervention at the target vessel due to symptoms or drop of ABI of  $\geq 20\%$  or  $>0.15$  when compared to post-procedure baseline ABI

# Trial Design

1. With symptoms of claudication and/or rest pain and angiographic evidence of SFA/PPA stenosis

2. Pre-dilatation mandatory for all subjects in IN.PACT SFA II phase only

# Endpoints

- **Primary Efficacy Endpoint <sup>[1]</sup>:**

Primary patency: 1-year freedom from clinically-driven TLR and DUS-derived restenosis (PSVR  $\leq$  2.4)

- **Primary Safety Endpoint <sup>[2]</sup>:**

Freedom from device- and procedure-related death through 30 days, and 1-year freedom from major amputation and clinically-driven TVR

1. Primary Efficacy Analysis on all ITT non-stented subjects based on superiority assumption of DCB vs. PTA
2. Primary Safety Analysis on all ITT non-stented subjects based on non-inferiority of DCB vs. PTA

# Key Eligibility Criteria

## Key Inclusions

- RC 2-3-4
- Lesion in SFA and/or PPA
- Single *de novo* or non-stented restenotic lesion:

## **TASC A, B, or C lesions**

- Combination and tandem lesions allowed if criteria above met and lesion gap  $\leq 3$  cm
- Successful inflow treatment

\* IN.PACT SFA I phase did not include pre-dilatation requirement for all subjects and did not exclude major interventions within 30 days prior to index procedure

<b>Clinical Success (%)</b> <sup>[3]</sup>	<b>99.1% (218/220)</b>	<b>97.3% (108/111)</b>	<b>0.103</b>

All ITT subjects (stented and non-stented)

1. Device success: Successful delivery, inflation, deflation, and retrieval of the intact study balloon without burst < RBP
2. Procedural success: Residual DS ≤ 50% for non-stented subjects or ≤ 30% for stented subjects
3. Clinical success: Procedural success without procedural complications (death, major target limb amputation, thrombosis of target lesion, or TVR) prior to discharge

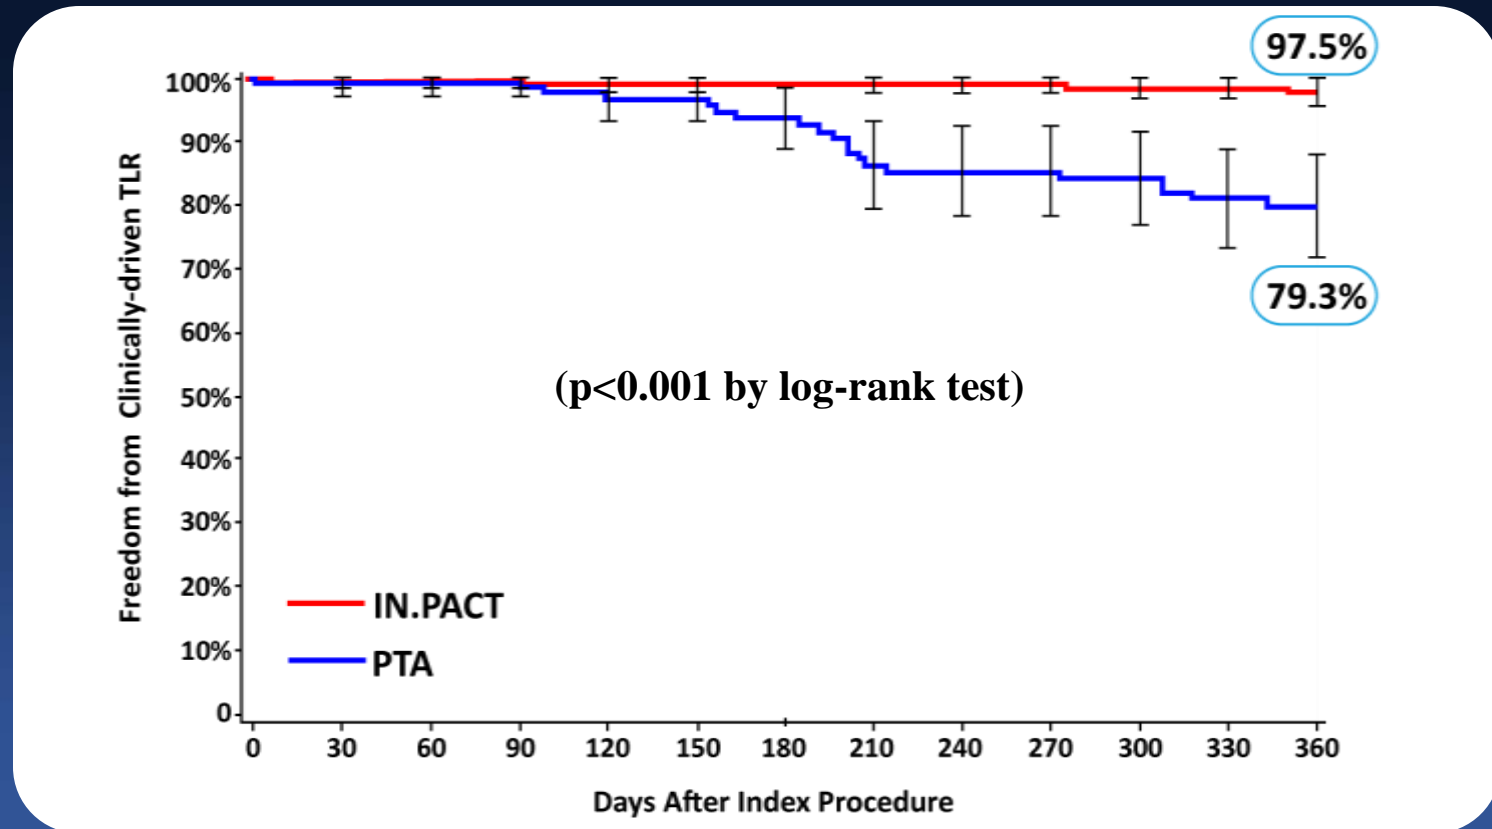

# ALL ITT, 12-month Primary Patency [1]

1. Primary patency is defined as freedom from clinically-driven TLR and freedom from restenosis as determined by duplex ultrasound (DUS) Peak Systolic Velocity Ratio (PSVR)  $\leq 2.4$

# ALL ITT, 12-month Clinically-driven TLR

	IN.PACT	PTA	<i>p</i>
Clinically-driven TLR <sup>[1]</sup>	2.4%	20.6%	<0.001 <sup>[2]</sup>

1. Clinically-driven TLR defined as any re-intervention due to symptoms or drop of ABI/TBI of >20% or >0.15 compared to post-procedure ABI/TBI
2. Actual event rate by frequency ratio algorithm calculation

# ALL ITT, 12-month Efficacy Outcomes

	<b>IN.PACT</b>	<b>PTA</b>	<i>p</i>
<b>Primary Patency (PSVR <math>\leq</math> 2.4)</b>	<b>82.2% (157/191)</b>	<b>52.4% (54/103)</b>	<b>&lt;0.001</b>
<b>Clinically-driven TLR <sup>[1]</sup></b>	<b>2.4% (5/207)</b>	<b>20.6% (22/107)</b>	<b>&lt;0.001</b>
<b>All TLR <sup>[2]</sup></b>	<b>2.9% (6/207)</b>	<b>20.6% (22/107)</b>	<b>&lt;0.001</b>
<b>Primary Sustained Clinical Improv. <sup>[3]</sup></b>	<b>85.2% (167/196)</b>	<b>68.9% (73/106)</b>	<b>&lt;0.001</b>

# In DCB, stent and dissection rates are high

## Stent Rate

## Flow Limiting Dissection Rate

# Conclusions

- DCB trials and registries already covered all TASC lesions.
- DCB showed promising patency rate in SFA lesions, but dissection and bail-out stent are drawback of DCB (TASC D 35% stent rate)
- Small registry data showed that atherectomy-based DCB strategy showed excellent synergistic patency results even in calcified or long SFA lesions with negligible use of stent.
- Therefore, routine use of DCB with/without plaque modification would be first line therapy in real practice in treating SFA lesions.
