How Can We Further Improve Reperfusion in AMI?:

Revising or Novel Approach

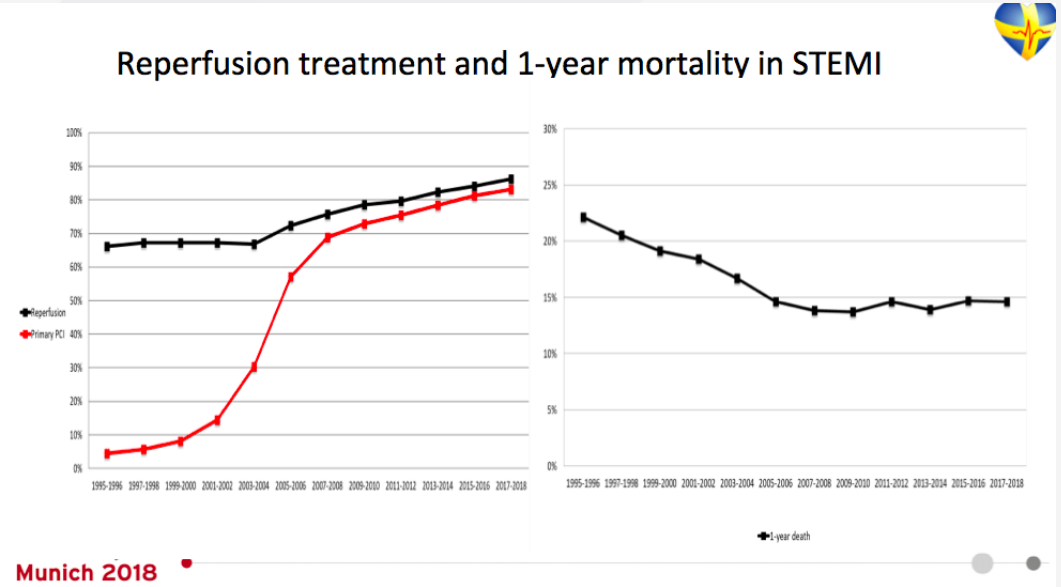
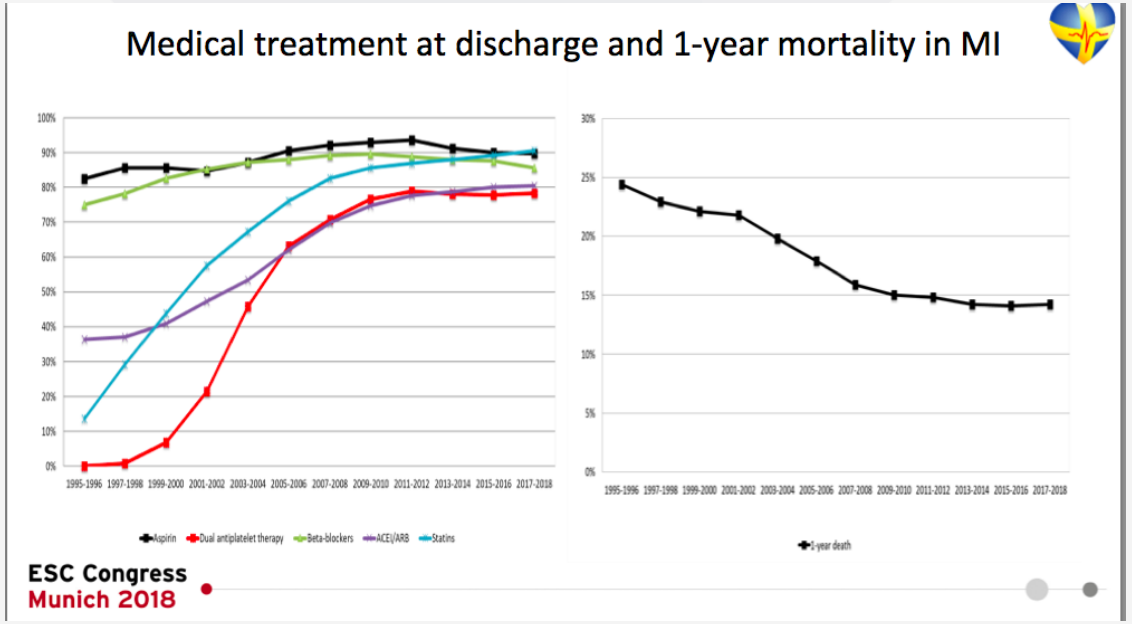
Reperfusion in STEMI

- Well its all fine isn’t it since we started primary PCI?
- Outcomes are good: whats the problem?

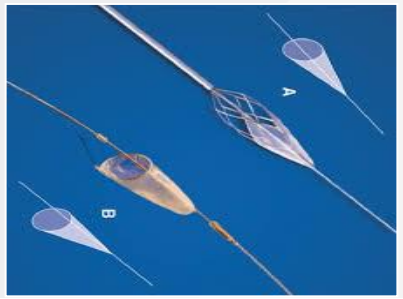
Improvement in the outcomes for STEMI patients have plateaued
But we seem to be doing our best !

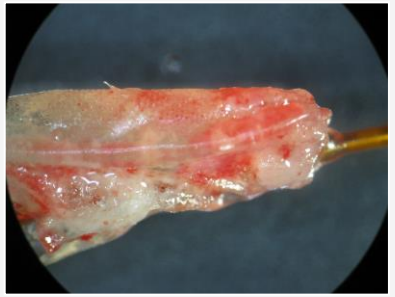


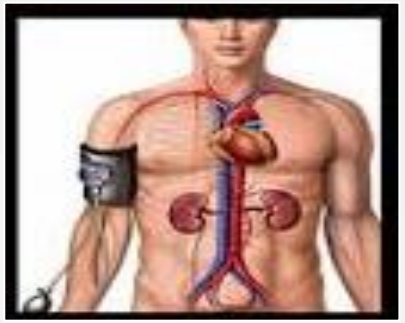


Which treatments have we tried in STEMI … and abandoned

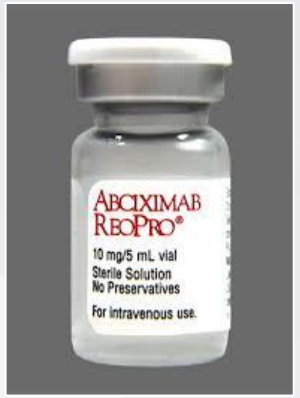
Mechanical







Pharmacological



To improve outcomes for those patients where “standard therapy” isnt enough – we need to know who they are likely to be

“Standard” therapy for STEMI

Anticoagulation, Predilation /aspiration, Stent, DAPT

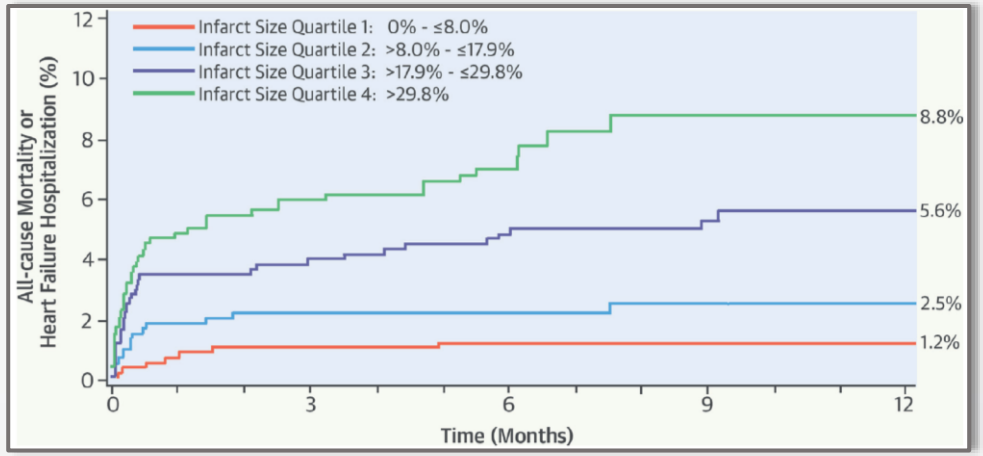
Works well for around 60-70% patients with STEMI

Individual identification would allow triage for additional therapy

Relationship Between Infarct Size and Clinical Outcomes Following PPCI

- Patient level meta-analysis 10 RCTs PPCI, N = 2362, infarct size assessed within 1 month by CMR or SPECT with clinical FU for >6M
- KM estimated 1 year rates:
  - ❖ All Cause Mortality 2.2%
  - ❖ Reinfarction 2.5%
  - ❖ Heart Failure Hospitalisation 2.6%

Infarct Size and Prognosis After PPCI



Relationship between Infarct Size and the Composite EP of All-Cause Mortality or HF Hospitalisation During 1Y FU

	Infarct Size >17.9%	Infarct Size ≤17.9%	HR [95% CI]	HR [95% CI]	P-Value for Interaction
	No. of Events/Total No.				
Age < vs ≥ median					0.10
<60 years	16/571 (2.8%)	1/592 (0.2%)		17.10 [2.27, 128.92]	
≥60 years	59/577 (10.2%)	20/600 (3.3%)		3.04 [1.83, 5.07]	
Gender					0.53
Male	43/911 (4.7%)	12/896 (1.3%)		3.47 [1.82, 6.60]

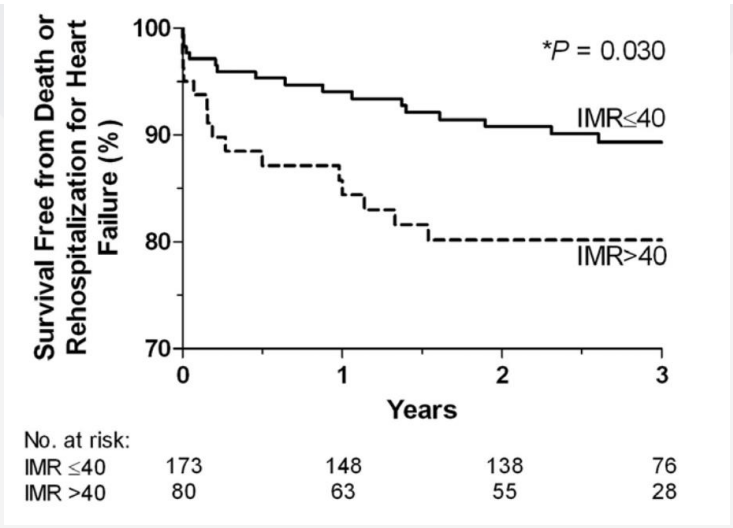
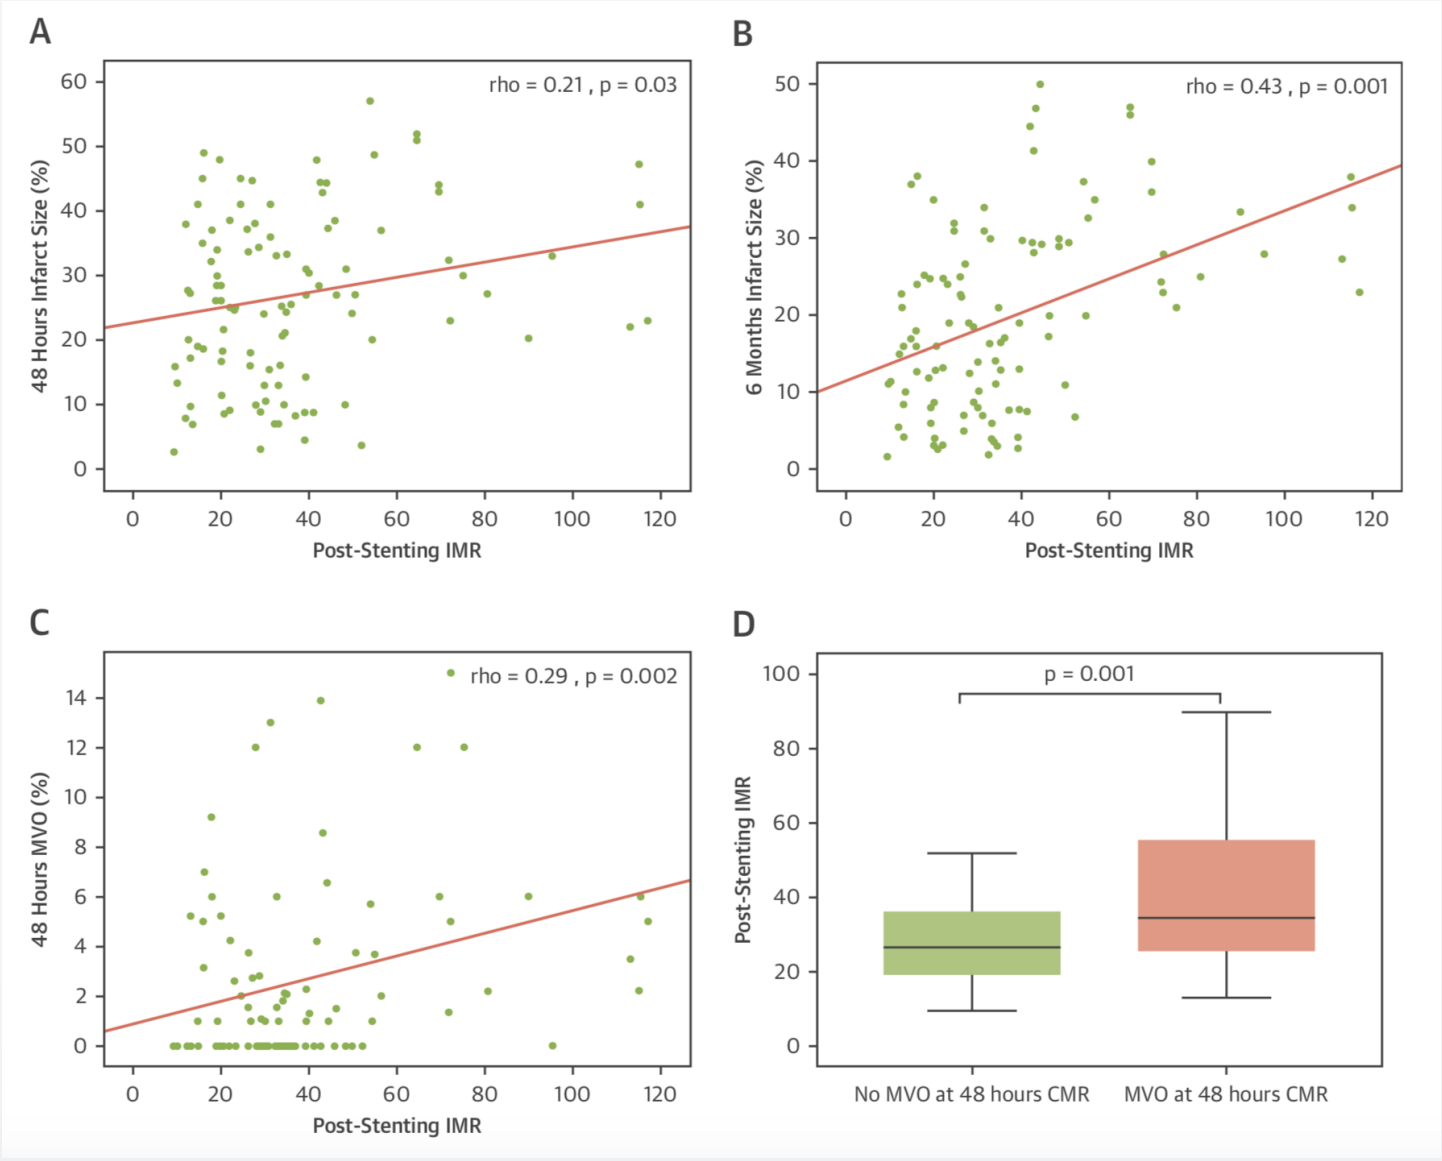
Prognostic Value of the Index of Microcirculatory Resistance Measured After Primary Percutaneous Coronary Intervention

William F. Fearon, Adrian F. Low, Andy S. Yong, Ross McGeoch, Colin Berry, Maulik G. Shah, Michael Y. Ho, Hyun-Sook Kim, Joshua P. Loh and Keith G. Oldroyd



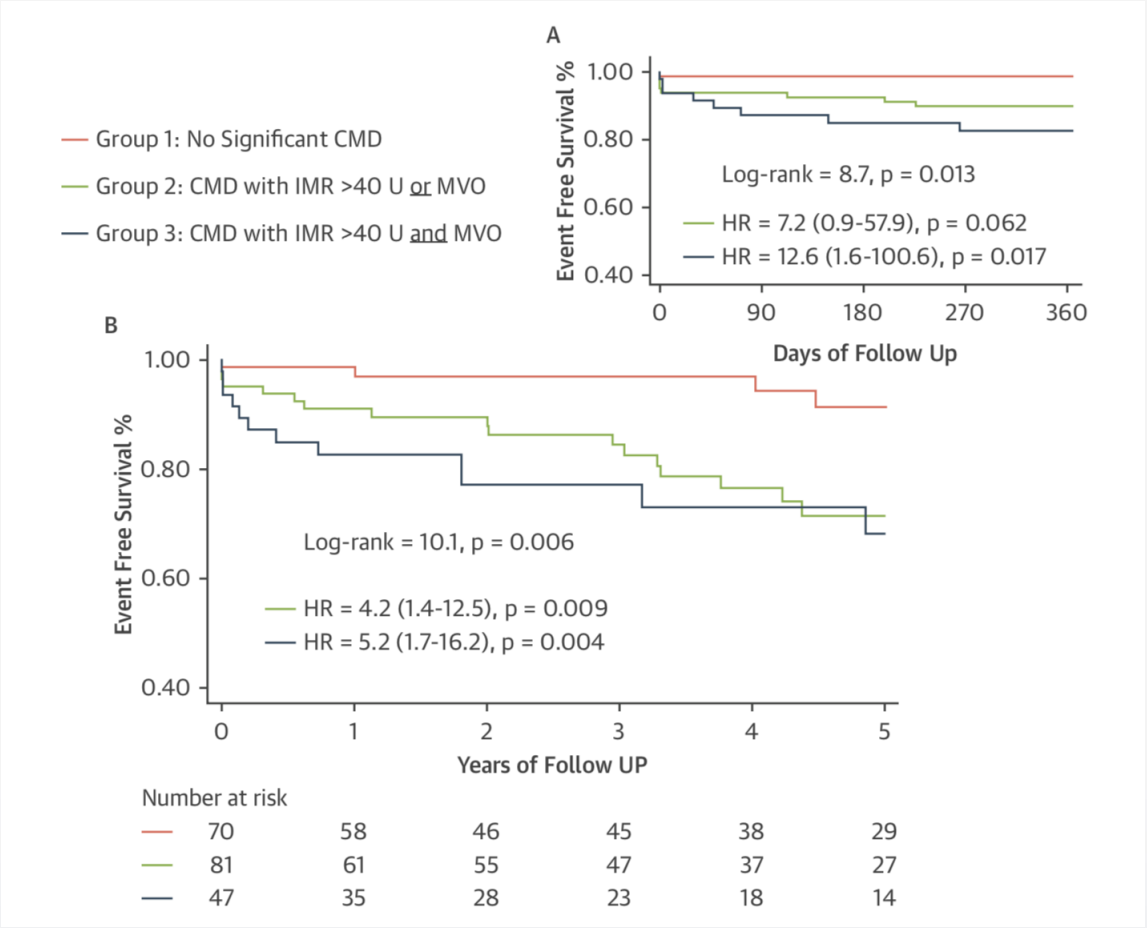
In STEMI an IMR > 40 at the end of the procedure predicts an adverse outcome

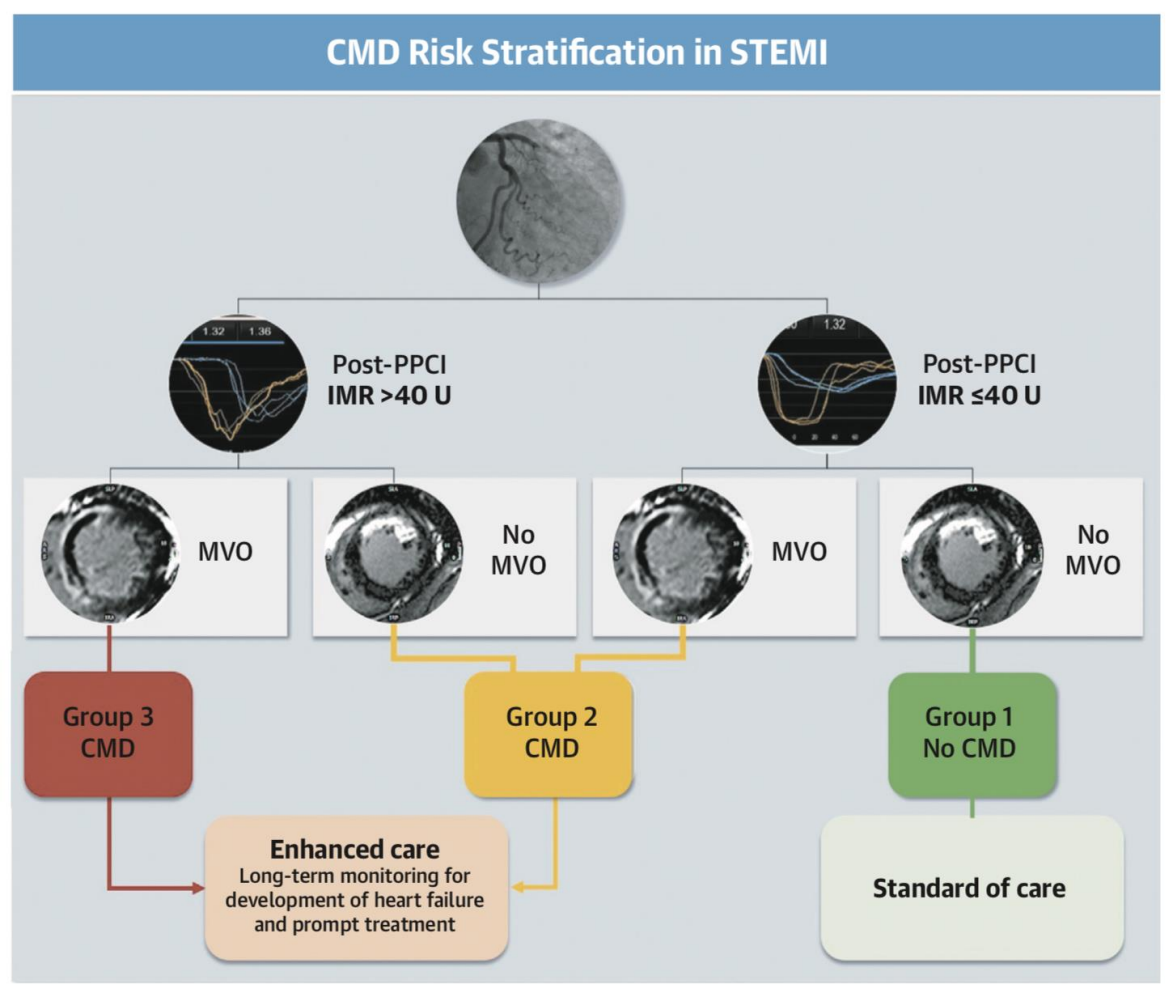


How do IMR & MRI measured infarct size /MVO relate in practice ?

De Maria, Banning A et al. JACC Cardiov Imaging 2019

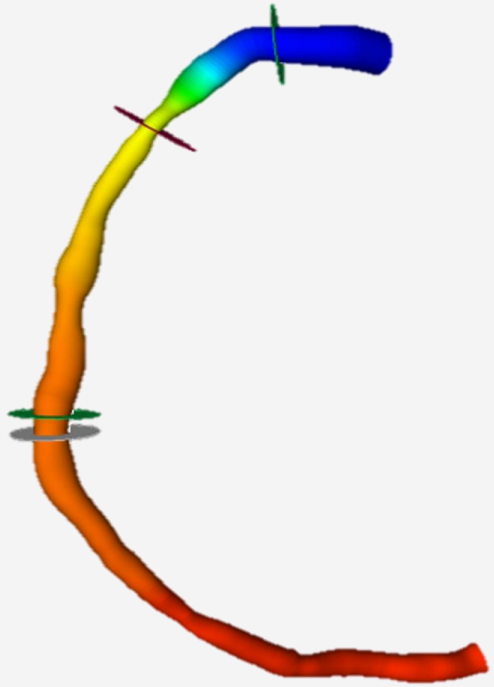
High IMR and/or MVO : impact on prognosis





Scarsini R, Banning A et al. JACC Cardiov Imaging 2021

Can we use a wire free angio-based index of CMD in STEMI?



- Application of invasive IMR in practice is limited

- Main limitations of IMR remains:
  - pressure-wire based technique
    - instrumentation of the infarct-related artery
    - extra procedural time
    - technical complexity
    - extra costs
- angio-derived IMR (IMR_{angio}) has been recently developed through application of computational flow dynamic to 3-D vessel modelling

Inclusion Criteria

1. Age ≥18 years old with **anterior STEMI**
2. Culprit lesion in proximal or mid LAD
3. Pre-PCI **TIMI flow 0 or 1**
4. Symptoms onset **time ≤ 12 h**
5. Patient deemed eligible for primary PCI
6. Consent per approved national ethical committee specific requirements prior to the procedure.

Exclusion Criteria

1. Implants or foreign bodies in the coronary sinus
2. Known allergy to polyurethanes, PET or stainless steel
3. Known pregnancy or breastfeeding
4. Pericardial effusion (cardiac tamponade)
5. Central hemodynamically relevant left/right shunt
6. Previous MI or CABG
7. History of stroke, TIA within last 6 months
8. Known Coagulopathy
9. Need for circulatory support or pre-procedural ventilation
10. CPR cardiac arrest for more than 5 min
11. Patient not suitable for femoral vein access
12. Contraindication to cardiac magnetic resonance imaging (CMR),
13. Active participation in another drug or device investigational study
14. Known severe kidney disease or on hemodialysis
15. Unconscious on presentation
16. Patients under judicial protection, legal guardianship or curatorship

PiCSO-AMI-I trial

In patients with anterior STEMI, TIMI 0-1 at presentation and ischaemic time < 12 h

- PiCSO assisted pPCI is feasible though it is associated with
  - *Prolonged procedural time*
  - *Increased contrast dye volume and radiation exposure*
- PiCSO assisted pPCI is not associated with increased rate of adverse events (device and non-device related) @ 6 months follow up
- In the PiCSO –AMI-I trial, PiCSO assisted pPCI did not reduce infarct size measured with CMR @ 5days or @6 months when compared to conventional pPCI

Conclusions

Outcomes for patients presenting with STEMI have plateaued

Surrogate measures of likely clinical outcome following/during STEMI are desirable

- Infarct size cMRI and MVO
- IMR measured with pressure wire (and possibly IMR_{angio})

Both MVO and IMR are predictive and may even be additive

Additional therapies for pts with STEMI are required for a sizeable minority – triaged therapy using IMR may be best approach
