Near-Infrared Spectroscopy and Inadequate Flow

■ STEMI
 ■ NSTEMI/UAP
 ■ Stable AP

Author	# of pt	Symptom	Morphological Predictor	Endpoint
Goldstein	62	■ ■	LCB I max4mm \geq 500	Trop or CK-MB>3UNL
Raghunathan	30	■ ■ ■	Lesion LCBI 145 vs 110	CK-MB>UNL

Goldstein et al Circ Cardiovasc Interv 2011;4:429-37, Raghunathan D et al. AJC 2011;107:1613-8

Is there a characteristic signal of lesions that cause STEMI?

Near infrared spectroscopy (InfraReDx) was performed immediately after infarct artery recanalization in 20 pts with STEMI

The NIRS chemograms of all 20 STEMI pts. The culprit segments contain LCP in 19 cases (95%), all with large plaque burden.

Is there a characteristic signal of lesions that cause STEMI?

Near infrared spectroscopy (InfraReDx) was performed immediately after infarct artery recanalization in 20 pts with STEMI

Ability of NIRS (maxLCBI_{4mm}) and IVUS (plaque burden and calcification) to distinguish the culprit segment from non-culprit segments of the STEMI culprit vessel:

- AUC for maxLCBI_{4mm} = 0.90
- AUC for plaque burden = 0.86

STEMI culprit vs. non-culprit segments

Mann-Whitney U test
Median \pm interquartile range

STEMI culprit lesions:
 $\text{maxLCBI}_{4\text{mm}} = 612 (438-817)$

Non-culprit lesions:
 $\text{maxLCBI}_{4\text{mm}} = 78 (0-234)$

$\text{MaxLCBI}_{4\text{mm}} > 400$ was present
at the STEMI culprit site in
63 of the 78 cases

$\text{MaxLCBI}_{4\text{mm}} > 400$ was present
at the non-culprit site in
22 of the 304 segments

Two/Three Vessel CAD (n= 87)

After stenting the target vessel
The non-target lesion underwent FFR

FFR \leq 0.8 \rightarrow IVUS, NIRS

Randomized

Standard

n = 43

Continue statin the patient was taking
Dual antiplatelet therapy for 1 year

Aggressive

n = 44

Rosuvastatin 40 mg daily
Dual antiplatelet therapy for 1 year

Follow up Cath (6-8 weeks)
FFR, IVUS and NIRS repeated.
If FFR \leq 0.8, lesion stented and imaging repeated.
If FFR > 0.8 the patient was treated medically.

Imaging data analyzed by CRF Core Lab
Data analysis for primary outcome analyzed by MSH independent Core Lab

Routine angio/3V IVUS-NIRS FU at 2 years

Clinical FU for ≥3 years

PI: Dr. Ron Waksman

“To evaluate the relationship between non-obstructive lipid-rich plaque and a new coronary events”

Summary

- 1. NIRS uses scattering and identify the absorption pattern in relation to the wave length which is unique for each plaque type.**
- 2. NIRS shows good reproducibility for evaluation of regression lipid rich plaque (LRP) in short time period (8 weeks).**
- 3. Large prospective studies are on-going to evaluate the natural history of LRP and feasibility of aggressive therapy for these lesions.**
