"Stroke Prevention in Non-Valvular Atrial Fibrillation"

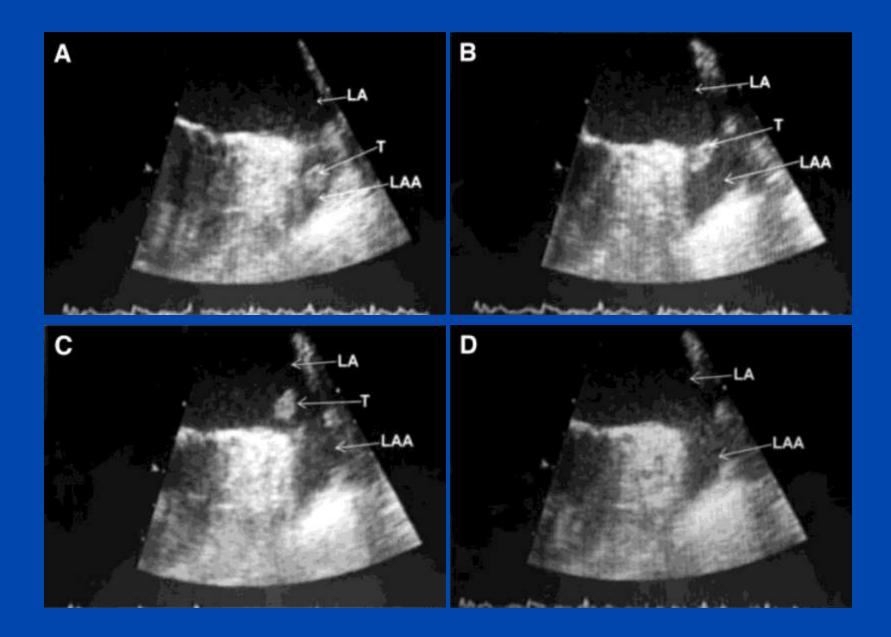

The following relationships exist related to this presentation:

None

MAYO CLINIC

Parekh A, Ezekowitz M et al: Circ 114:e513, 2006

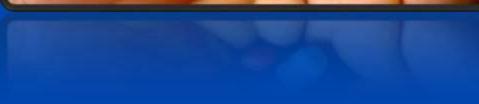

Atrial Fibrillation Patients

- Stroke is single most feared complication of CV disease
- Higher mortality and morbidity than non-embolic strokes
- 20-40% of all strokes are related to NVAF
- Up to 15-20% AF strokes fatal
- High recurrence rates
- Cost of treatment
- Cost of prevention

Equipoise

 A state of genuine uncertainty is a requisite for randomized clinical trials

Complex

- Theoretical equipoise
- Clinical equipoise

Nonvalvular Atrial Fibrillation Concepts

- Although risk scores are imperfect all patients with nonvalvular atrial fibrillation should be evaluated for risk of stroke/systemic embolism and bleeding
- There are several strategies for stroke prevention in high risk patients
- Patients should be given the information about these strategies in a way that they can understand them
- Patients increasingly are at the center of shared decision making

- Coumadin
- Dabigatran
- Rivaroxaban
- Apixaban
- Edoxaban

- Watchman
- Amulet
- LARIET

Stroke Prevention Strategies Anticoagulation

- Studied and found effective in large studies
- Is associated with bleeding
- NOACs are better than Coumadin
- Compliance is an important issue (willpower)
- Issues of cost and convenience
- Do not prevent all strokes
- Hemorrhagic strokes have highest morbidity and mortality

Original Investigation

Oral Anticoagulant Therapy Prescription in Patients With Atrial Fibrillation Across the Spectrum of Stroke Risk Insights From the NCDR PINNACLE Registry

Jonathan C. Hsu, MD, MAS; Thomas M. Maddox, MD, MSc; Kevin F. Kennedy, MS; David F. Katz, MD; Lucas N. Marzec, MD; Steven A. Lubitz, MD, MPH; Anil K. Gehi, MD; Mintu P. Turakhia, MD, MAS; Gregory M. Marcus, MD, MAS

Results: The study cohort comprised 429,417 outpatients with AF. Their mean (SD) age was 71.3 (12.9) years, and 55.8% were male. Prescribed treatment consisted of an OCA (192,600 [44.9%]), aspirin only (111,134 [25.9%]), aspirin plus a thienopyridine (23,454 [5.5%]), or no antithrombotic therapy (102,229 [23.8%]). Overall, OAC prescription prevalence did not exceed 50% even in higherrisk patients with a CHADS₂ score exceeding 3 or a CHA₂DS₂-VASc score exceeding 4.

Original Investigation

Oral Anticoagulant Therapy Prescription in Patients With Atrial Fibrillation Across the Spectrum of Stroke Risk Insights From the NCDR PINNACLE Registry

Jonathan C. Hsu, MD, MAS; Thomas M. Maddox, MD, MSc; Kevin F. Kennedy, MS; David F. Katz, MD; Lucas N. Marzec, MD; Steven A. Lubitz, MD, MPH; Anil K. Gehi, MD; Mintu P. Turakhia, MD, MAS; Gregory M. Marcus, MD, MAS

IMPORTANCE Patients with atrial fibrillation (AF) are at a proportionally higher risk of stroke based on accumulation of well-defined risk factors.

OBJECTIVE To examine the extent to which prescription of an oral anticoagulant (OAC) in US

Conclusions and Relevance: In a large quality improvement registry of outpatients with AF, prescription of OAC therapy increased with a higher CHADS₂ score and CHA₂DS₂-VASc score. However, a plateau of OAC prescription was observed, with less than half of high-risk patients receiving an OAC prescription.

71.3 (12.9) years, and 55.8% were male. Prescribed treatment consisted of an OAC (192 600 [44.9%]), aspirin only (111 134 [25.9%]), aspirin plus a thienopyridine (23 454 [5.5%]), or no antithrombotic therapy (102 229 [23.8%]). Each 1-point increase in risk score was associated with increased odds of OAC prescription compared with aspirin-only prescription using the CHADS₂ score (adjusted odds ratio, 1.158; 95% CI, 1.144-1.172; P < .001) and the CHA2DS₂-VASc score (adjusted odds ratio, 1.163; 95% CI, 1.157-1.169; P < .001). Overall, OAC prescription prevalence did not exceed 50% even in higher-risk patients with a CHADS₂ score exceeding 3 or a CHA₂DS₂-VASc score exceeding 4.

CONCLUSIONS AND RELEVANCE In a large quality improvement registry of outpatients with AF, prescription of OAC therapy increased with a higher CHADS₂ score and CHA₂DS₂-VASc score. However, a plateau of OAC prescription was observed, with less than half of high-risk patients receiving an OAC prescription.

Adherence to OAC

 U.S. commercial insurance data base (administrative claims) 66,661 patients with atrial fibrillation treated between November 2010 and December 2014

ApixabanDabigatranRivaroxabanWarfarin

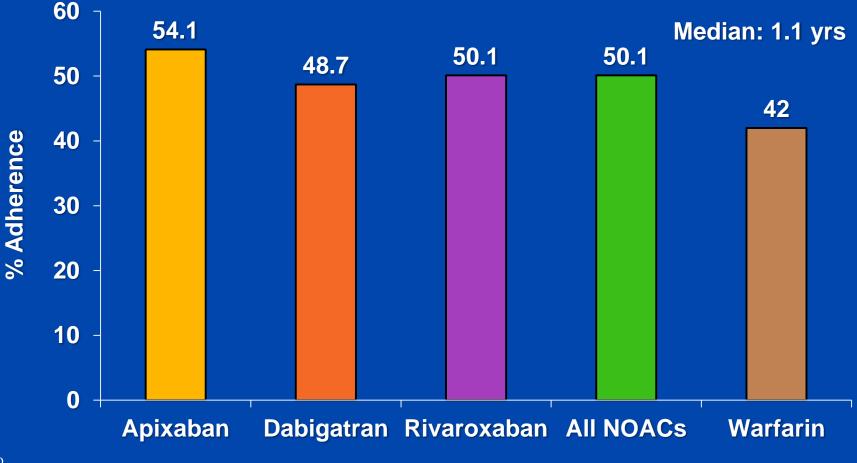

CHA₂DS₂VASc score ≥2	~90%
HAS-BLED ≥3	~50%
Median F/U	1.1 yrs

Adherence to OAC Proportion of Days Covered

$CHA_2DS_2VASc \text{ score } \ge 4$

Yao et al: J Am Heart Assoc doi:10.1161/JAHA.115.003074, 2016

RELY AF Registry

- Prospective registry patients presenting to ER with AF
- 164 sites, 64 countries
 - 15,400 patients
 - 2008-2011
- Use of oral anticoagulation prescribed
 - 58% of patients worldwide with CHADS₂ ≥2
 - Range 11.2% 65.7%

Willpower lasts about 30 days and is soluble in alcohol

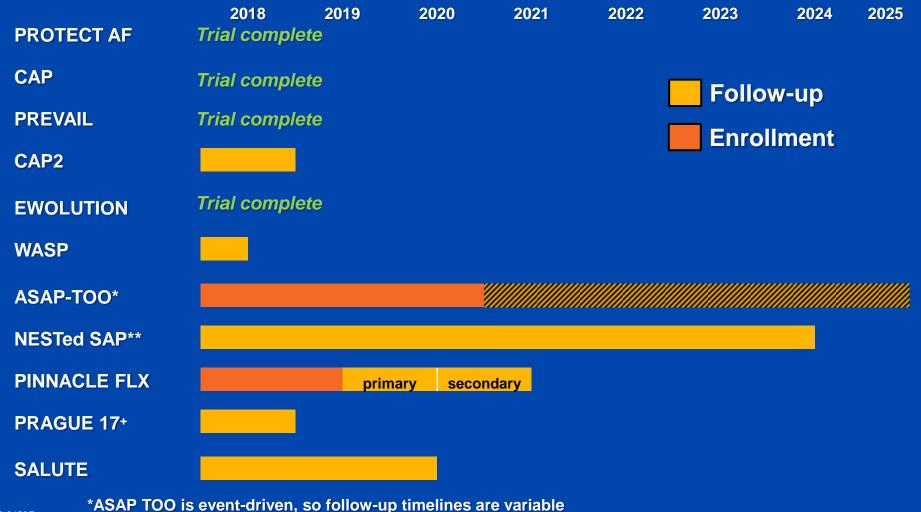

Stroke Prevention Strategies Devices – Local Site Specific

- Studied and found effective in RCTs and registries
- Have small procedural adverse events
- Major reduction in hemorrhagic stroke
- Improvement in survival
- Are associated with decreased bleeding because AC is usually avoided
- Do not prevent strokes which are not related to LAA
- Eliminate noncompliance issues

Clinical Trial Timelines

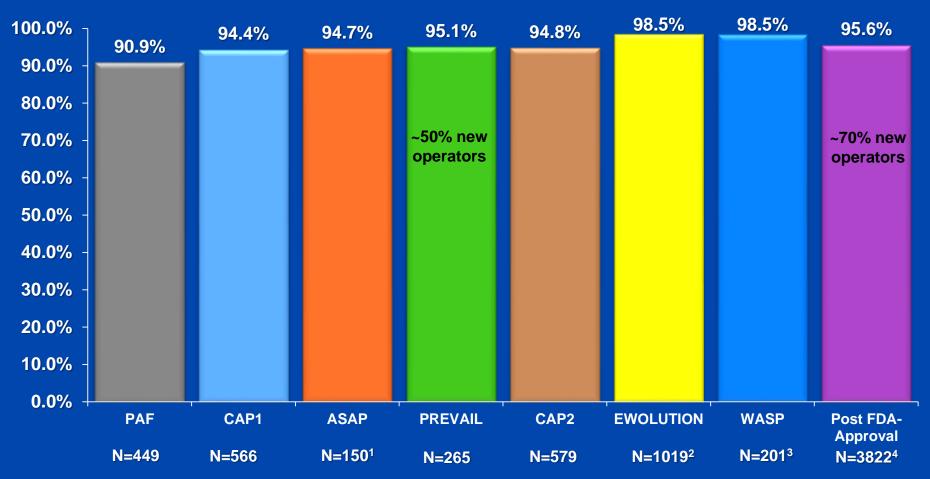

**Novel Evaluation of the WATCHMAN LAA Closure Therapy Surveillance Analysis Plan

+ Czech Ministry of Health sponsored study

Consistent Procedural Success

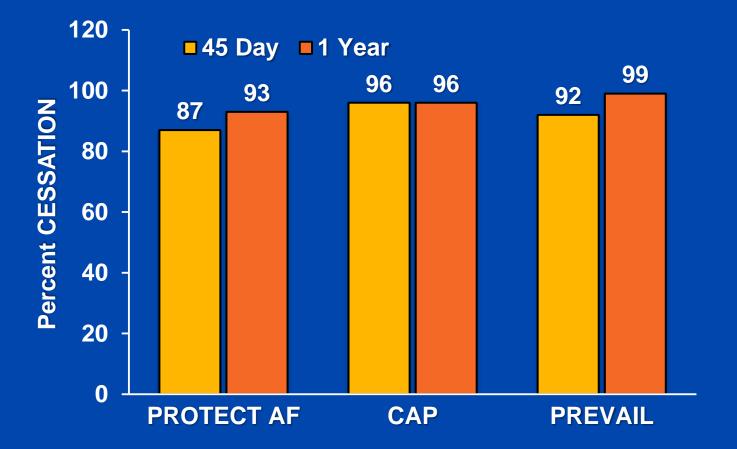

Implant success defined as deployment and release of the device into the LAA; no leak ≥ 5 mm

Patient-Level Meta-Analysis **WATCHMAN Superior Reduction in Disabling Strokes**

What Then Can We Say? LAAC

- Atrial fibrillation and stroke prevention is a global unmet need
- Has been used mainly as second line therapy; first line therapy anticoagulation has significant gaps
- LAAC is effective
 - Dramatic reduction in hemorrhagic stroke
 - Significant reduction in mortality
 - Significant reduction in bleeding
 - Can be used in patients in whom anticoagulation is either contraindicated or not optimal
- Multiple devices are either approved or CE mark available

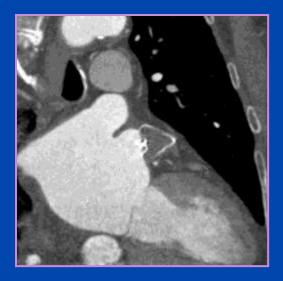

Certificate of Compliance

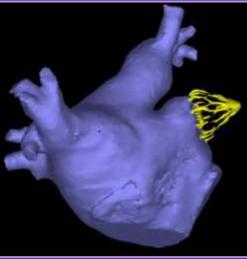

- Patients who could be treated with warfarin/NOACS
- Patients who choose not to be treated with warfarin/NOACS
- Contraindications to warfarin/NOACS
- In concert with ablation

Stroke and Atrial Fibrillation Alternative to Warfarin or NOACS

- Patients who could be treated with warfarin/NOACS
- Patients who choose not to be treated with warfarin/NOACS
- Contraindications to warfarin/NOACS
- In concert with ablation
