---

# Casus

- 72 years old Male
- Referred
- Diabetes
- Previous CABG
- Triple therapy
- Angina 3+/4 Positive MIBI-Spect
- Inferoposterior lateral

- 
- After successful opening of RCA:  
persistent angina 3/4

- 
- After PCI Margo Obtusis  
1/4 Angina

---

# Learning Objectives

- Do not over - or underestimate the vessel size with CTO
- The vessel responsible for complaints, is sometimes difficult to identify
- Angina class is very important for the patient!

---

# A Randomized Multicentre Trial to Evaluate the Utilization of Revascularization or Optimal Medical Therapy for the Treatment of Chronic Total Coronary Occlusions

*Gerald S. Werner, MD PhD on behalf of the EURO CTO trial investigators*

---

# Study design

- Prospective, open-label, multi-centre randomized trial
- Primary efficacy endpoint: the effect of PCI as compared to OMT on the health status at 12 months follow-up as assessed by the Seattle Angina Questionnaire (SAQ)
- Primary safety endpoint: the safety of performing PCI as compared to OMT for a CTO in stable coronary artery disease during 3 years of follow-up

[www.clinicaltrials.gov](http://www.clinicaltrials.gov). NCT01760083

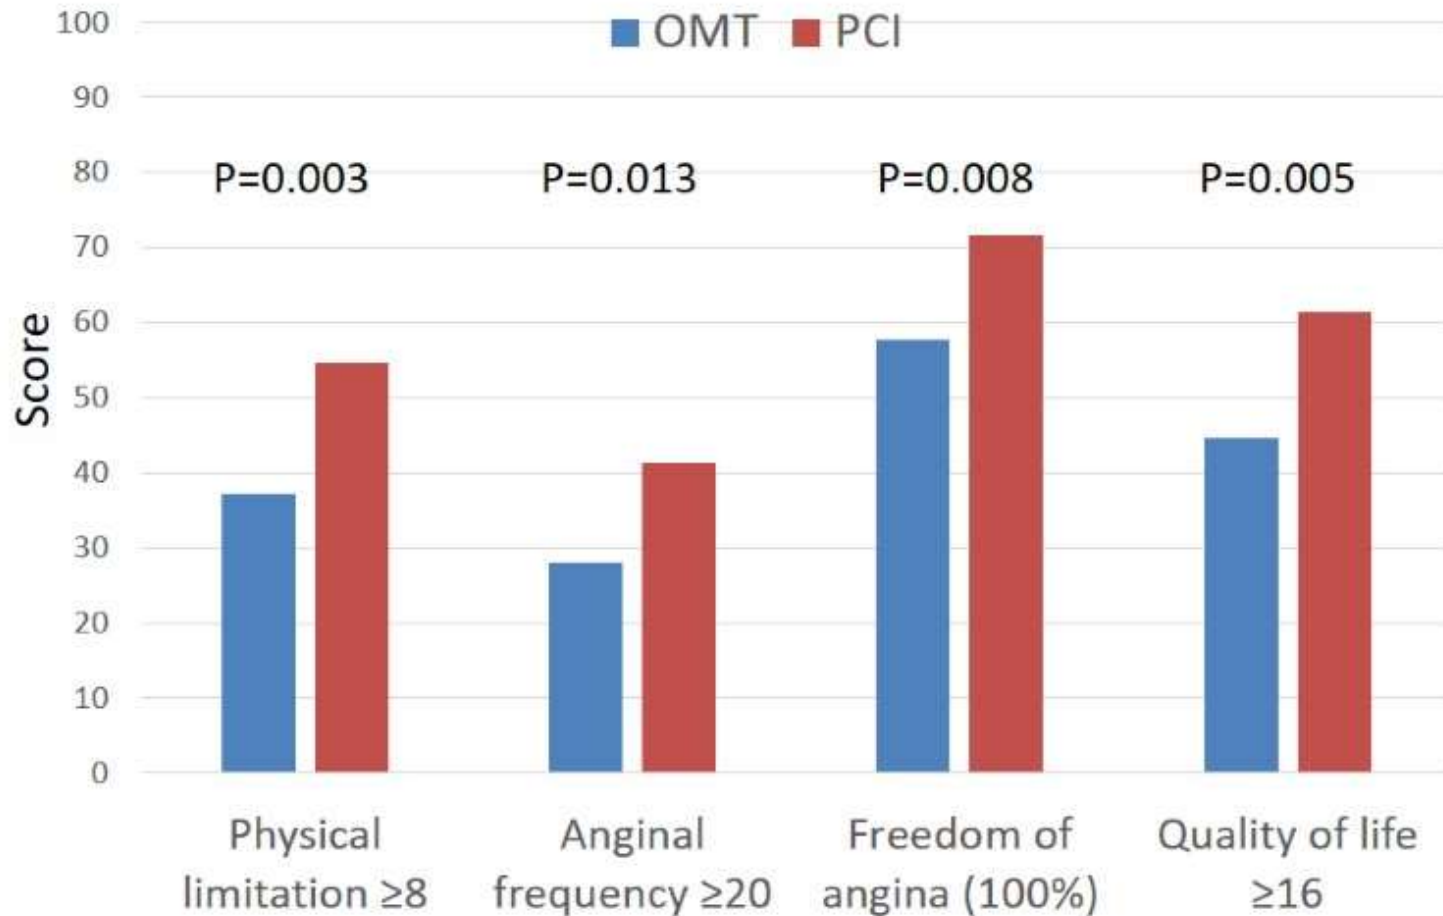

## MACCE during follow-up

	OMT (N=137)	PCI (N=259)	P-value
Patients with any adverse event	9 (6.7)	13 (5.2)	0.52
All cause Death	0	2 (0.8)	0.55
Cardiac death	0	2 (0.8)	
Myocardial infarction	0	5 (1.9)	0.17
Non-Q-wave	0	4 (1.6)	
Q-wave	0	1 (0.4)	
Ischemia-driven revascularization	9 (6.7)	7 (2.9)	0.10
Cerebrovascular event	1 (0.7)	2 (0.8)	0.99
Stent thrombosis	0	1 (0.4)	0.99

Number of patients (%)

## Significant change in SAQ subscale scores \*)

Higher score, better health status

\*) Spertus et al. JACC 1995;25:333-41

# Changes in CCS class during follow-up
