**Total MV 6.1% (4/66)**

**Total SB 22.7% (15/66)**

## DCA/STENT in Bifurcation Lesions

### *AMIGO Trial*

*All AMIGO data*

*Milan Subgroup*

# Hypothesis & Objective

## Hypothesis;

- Plaque removal by DCA prior to DES implantation for lesions located in bifurcation has the potential to reduce restenosis rate and improve long-term outcomes.

## Objective;

- To evaluate the efficacy of pre DES plaque modification by DCA for ostial or bifurcated lesion

# Study Design

- Multi-center non-randomized prospective registry
- DCA debulking prior to Cypher stenting for **ostial or bifurcated lesion**
- 9-month angiographic and clinical follow-up
- **15** Japanese centers

## Inclusion Criteria

- Significant stenosis on located in distal LMT, ostium of LAD or LCx, or major bifurcation.
- De novo lesion
- Suitable morphology for DCA catheter delivery (no severe calc and acute proximal bending)
- Reference diameter  $> 2.5\text{mm}$  by visual estimate

## Exclusion Criteria

- Bypass graft
- Bending  $> 60^\circ$
- Restenotic lesion
- Thrombotic lesion
- AMI (within 2 weeks) lesion

# Endpoints

## Primary endpoint

- Angiographic restenosis ( $>50\%$  DS)  
at 9 months

## Secondary endpoint

- MACE, TLR, TVR by 9 months

# Patients Characteristics

(Aug. 2004 ~ Oct. 2005)

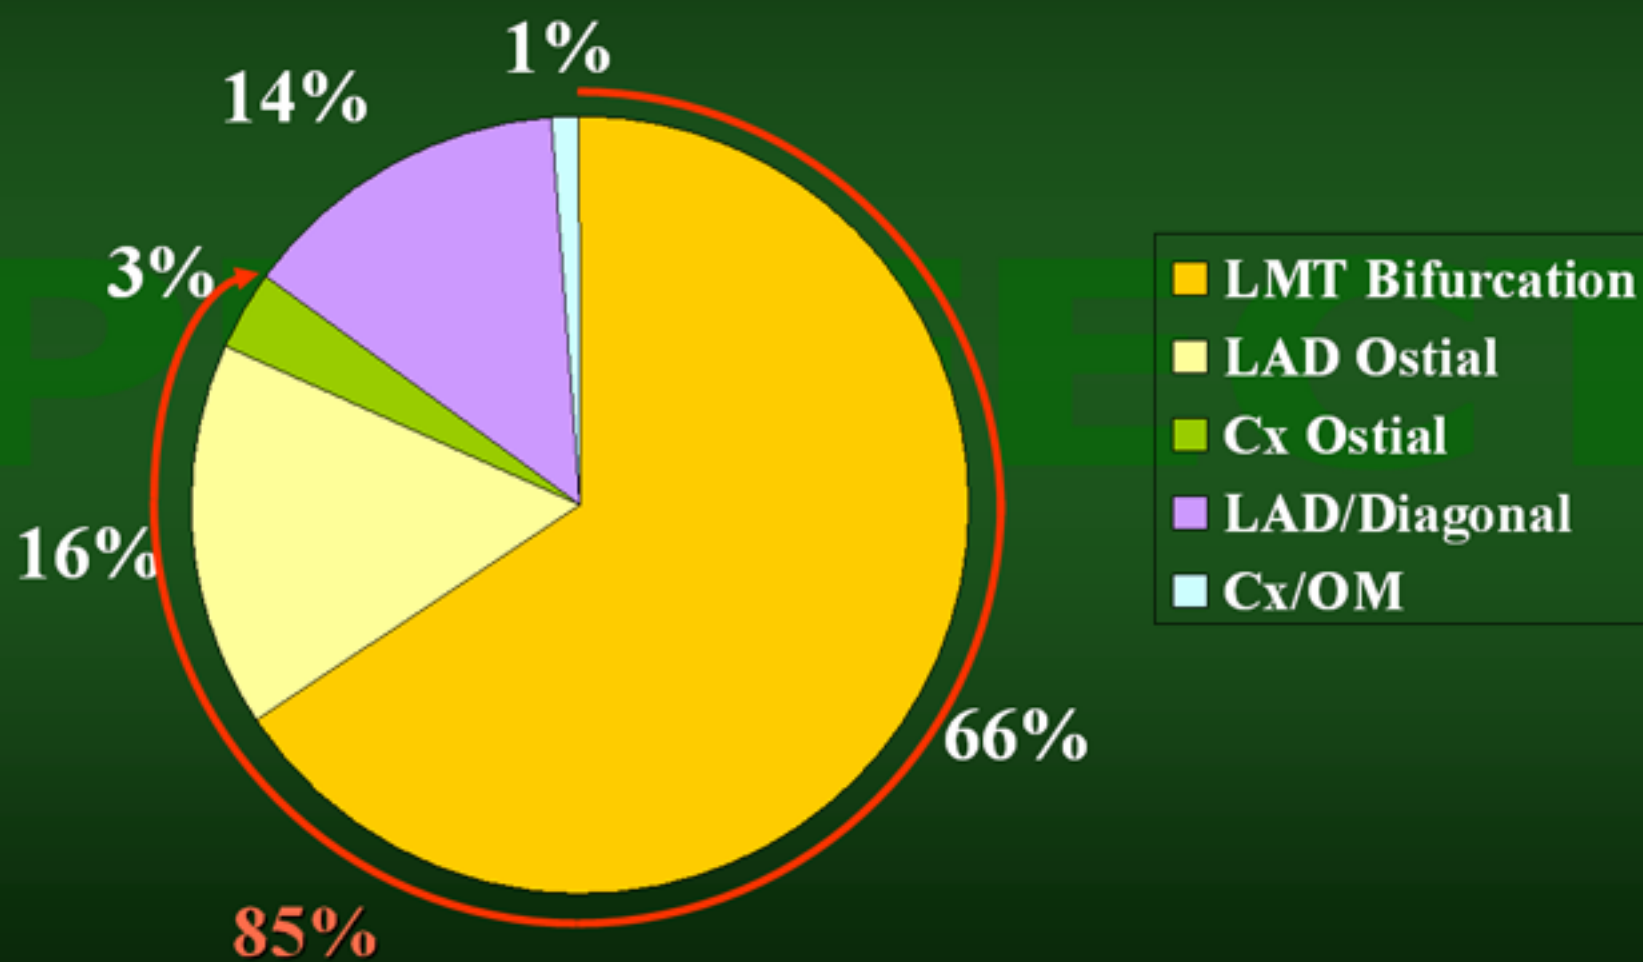

---

Number	92
Male	78 (85%)
Age (y.o)	67 $\pm$ 11
Prior MI	33 (36%)
Prior CABG	2 (2%)
UA	22 (24%)
HT	52 (57%)
DM	24 (26%)
HL	45 (49%)
H/O smoking	31 (34%)

---

## Lesion Location (n=92)

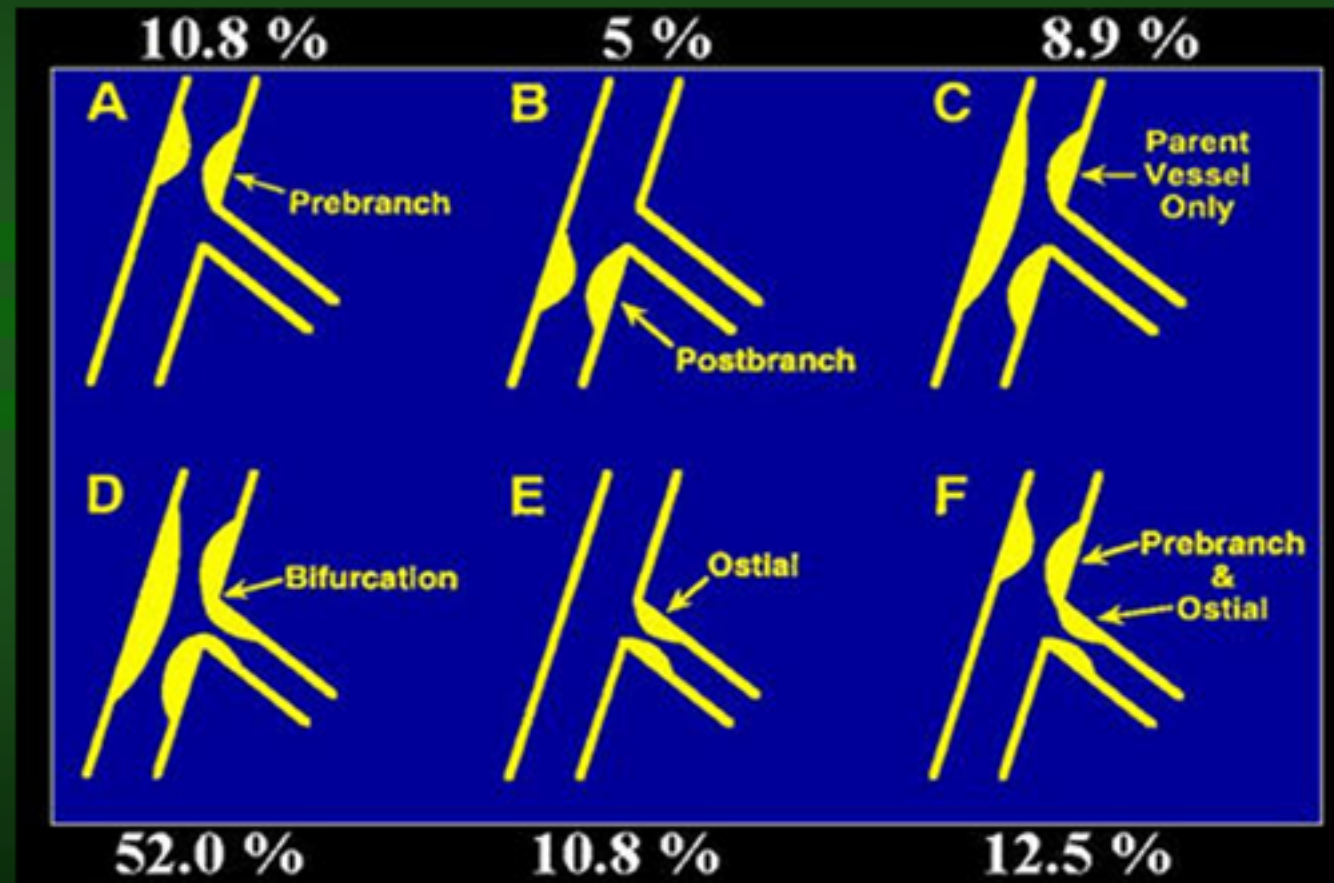

# Classification of Bifurcation Lesions

## *Duke Classification*

Bifurcation lesion classified into 6 types.

Type D lesion consists 52% of bifurcation lesion.

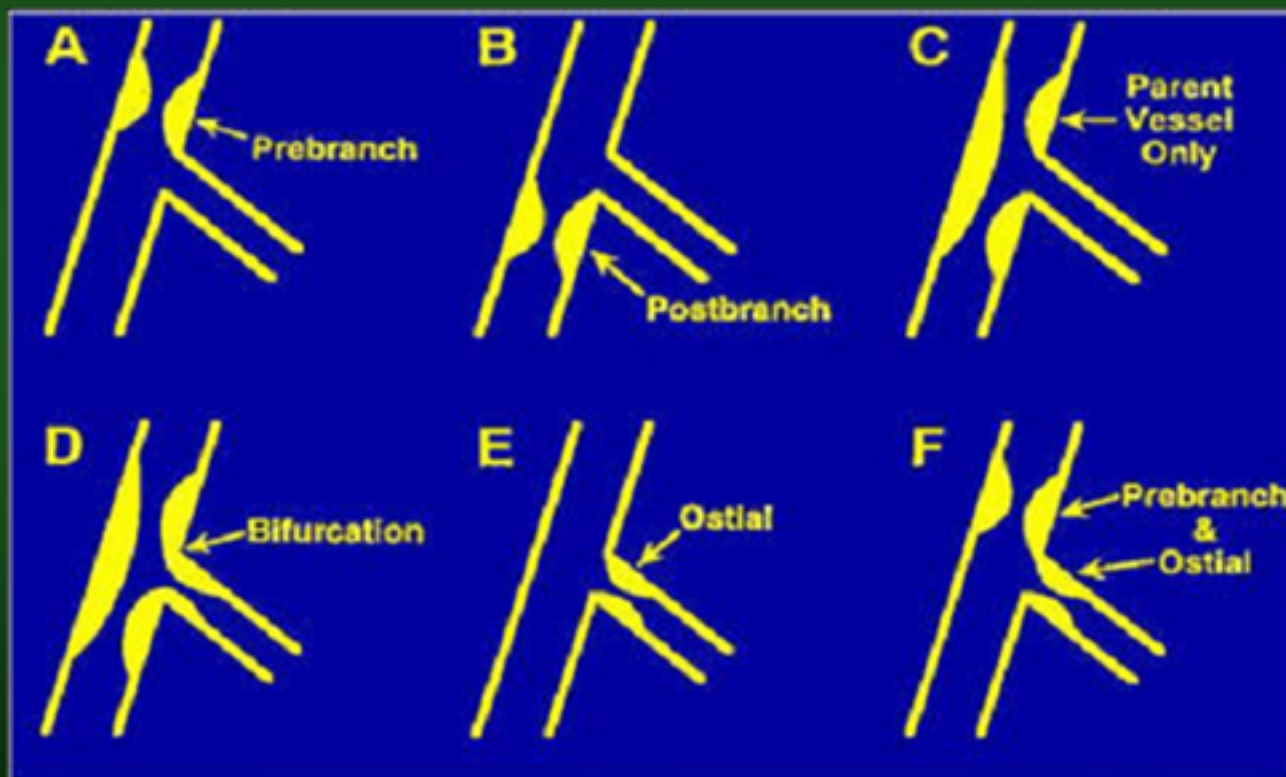

# Classification of Bifurcation Lesions

<b>T STENT</b>	<b>1 %</b>	<b>1</b>
<b>Culotte STENT</b>	<b>1 %</b>	<b>1</b>

KBT: kissing balloon technique; SB: side branch

# Stenting Procedural Results

---

Number	92
Delivery success	92 (100%)
Stent size	$3.33 \pm 0.25$ mm
Total length of stents	$21.9 \pm 4.2$ mm
Max. inflation pressure	$17.2 \pm 3.0$ atm
No of STENT	$1.36 \pm 0.62$

---

# In-Hospital Outcomes

(n=92)

1) Death	0%
2) Em-CABG/TLR	0%
3) QMI	0%
4) Non-QMI	2%
5) Complication at access site	0%

# QCA Analysis

## Main Branch

---

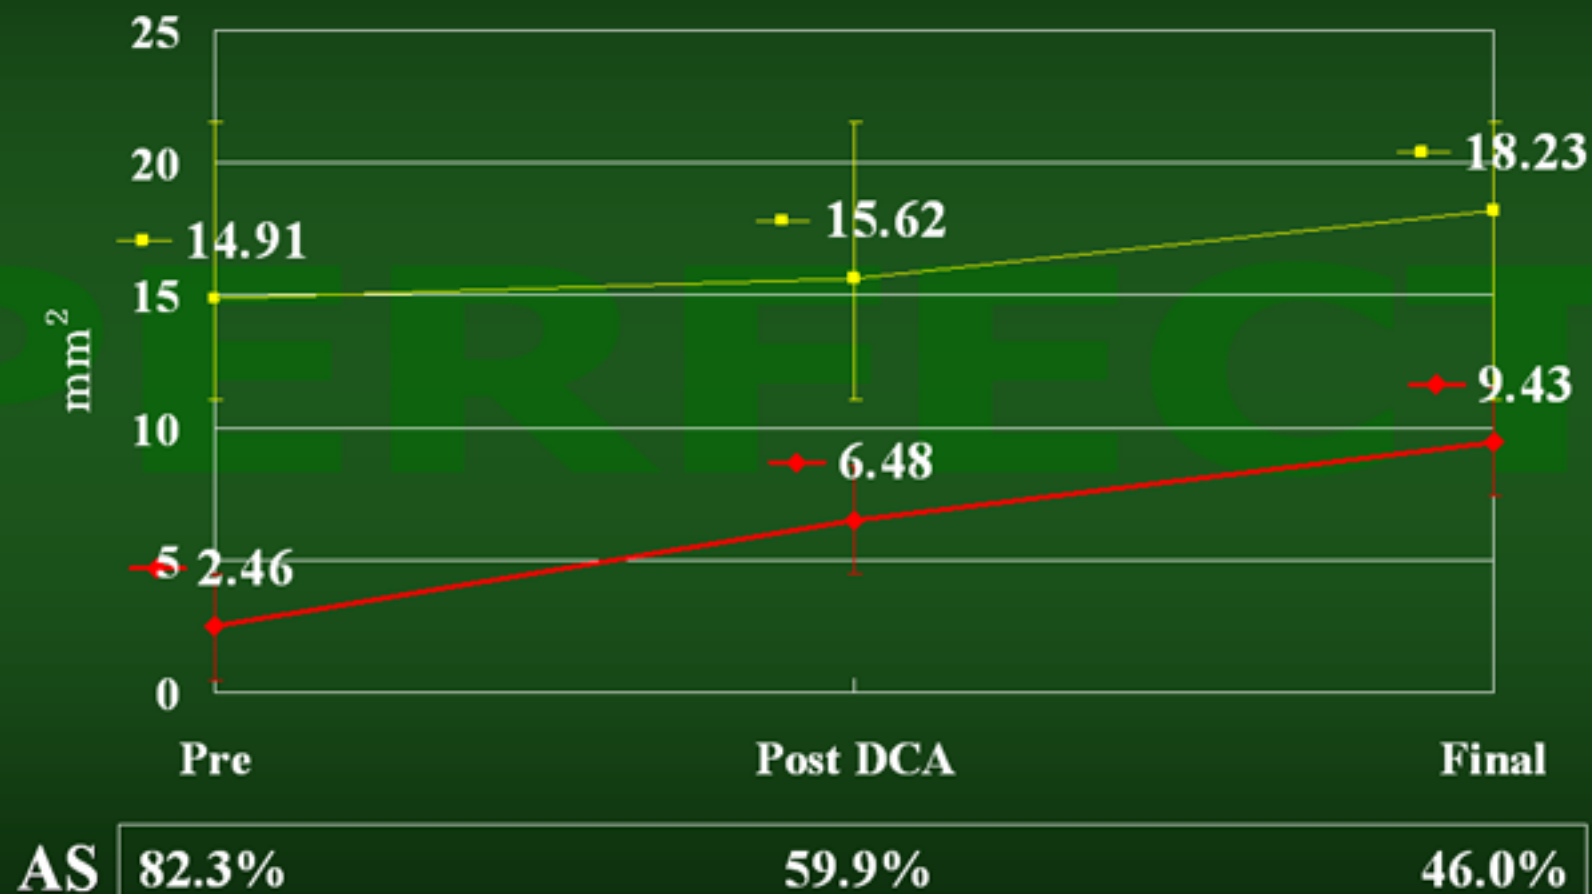

Pre	Lesion length	$16.7 \pm 8.3$ mm
	RVD	$3.33 \pm 0.45$ mm
	MLD	$1.34 \pm 0.37$ mm
	Percent DS	$59.9 \pm 9.3$ %
Post	RVD	$3.83 \pm 0.43$ mm
	MLD	$3.47 \pm 0.65$ mm
	Percent DS	$9.4 \pm 11.8$ %

---

# QCU Analysis (Main Branch):

Vessel area, Lumen area, Area stenosis

## 9Mo Follow-up Clinical Results

- Until Feb.2006, Fu CAG was performed in 42 patients.  
(46% Fu rate; Fu data collection is still on going.)
- No death, no CABG, no MI
- No TLR for the main branch
- TLR for the side branch in 1 patient (2.4%)

## 9Mo Follow-up QCA Results

■ Fu duration:  $251 \pm 66$  days

■ Main Branch

reference	$3.50 \pm 0.43$ mm
MLD	$3.13 \pm 0.58$ mm
percent DS	$10.7 \pm 10.7$ %

Side Branch

reference	$2.50 \pm 0.61$ mm
MLD	$1.84 \pm 0.56$ mm
percent DS	$25.5 \pm 17.4$ %

## 9Mo Follow-up QCA Results

■ Fu duration:  $251 \pm 66$  days

■ Binary restenosis rate

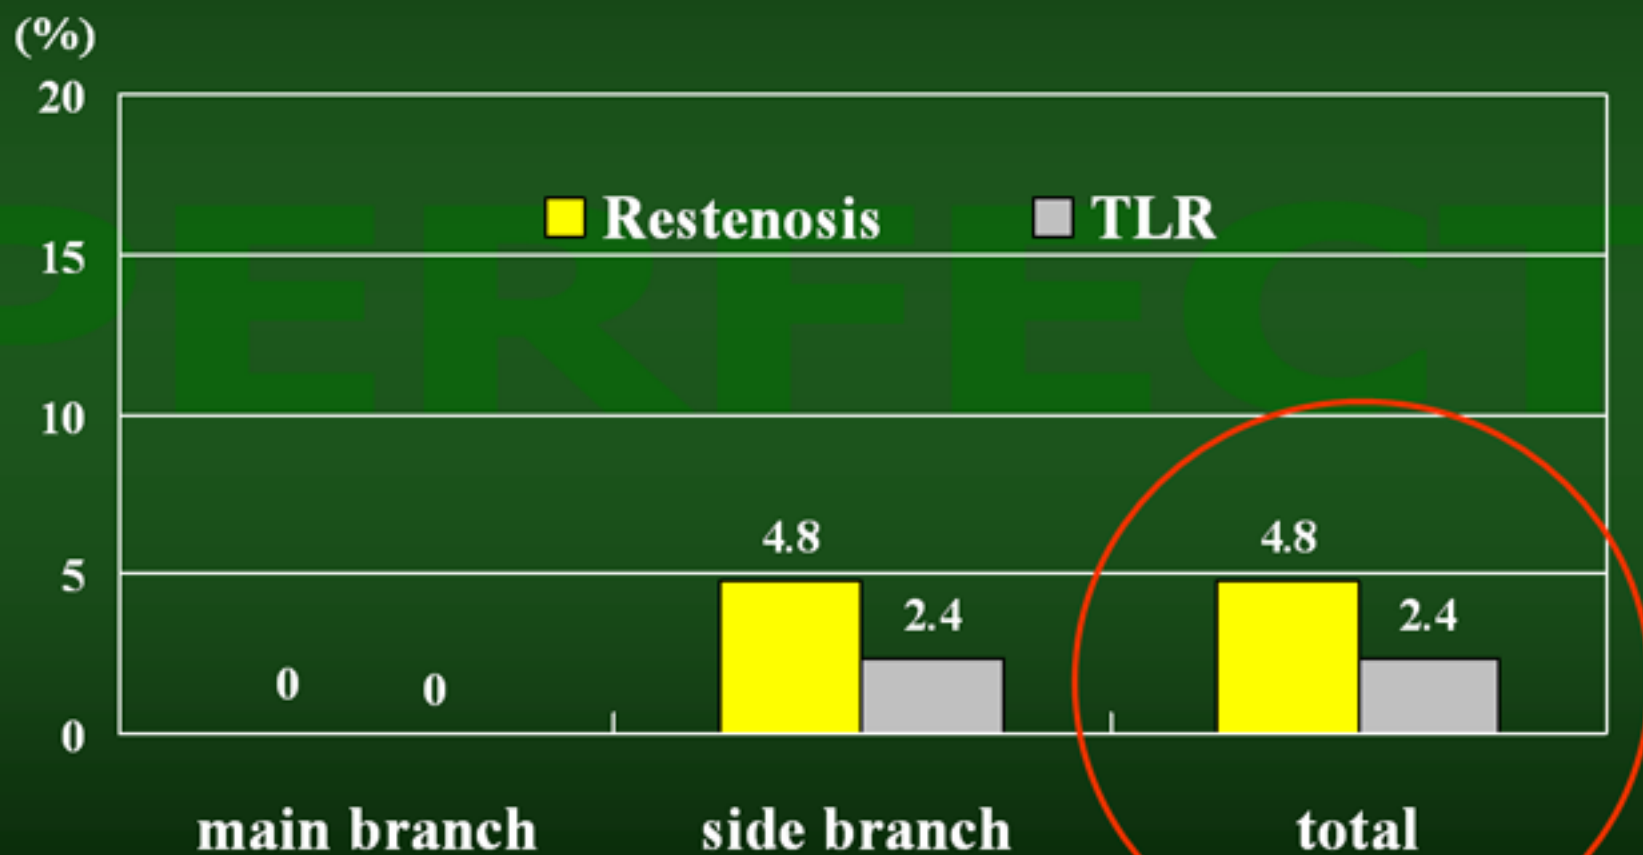

Main branch: 0%

Side branch: 4.8% (2/42)

## 9Mo Follow-up

### Binary restenosis / TLR rate

## Restenosis and TLR Case for side branch

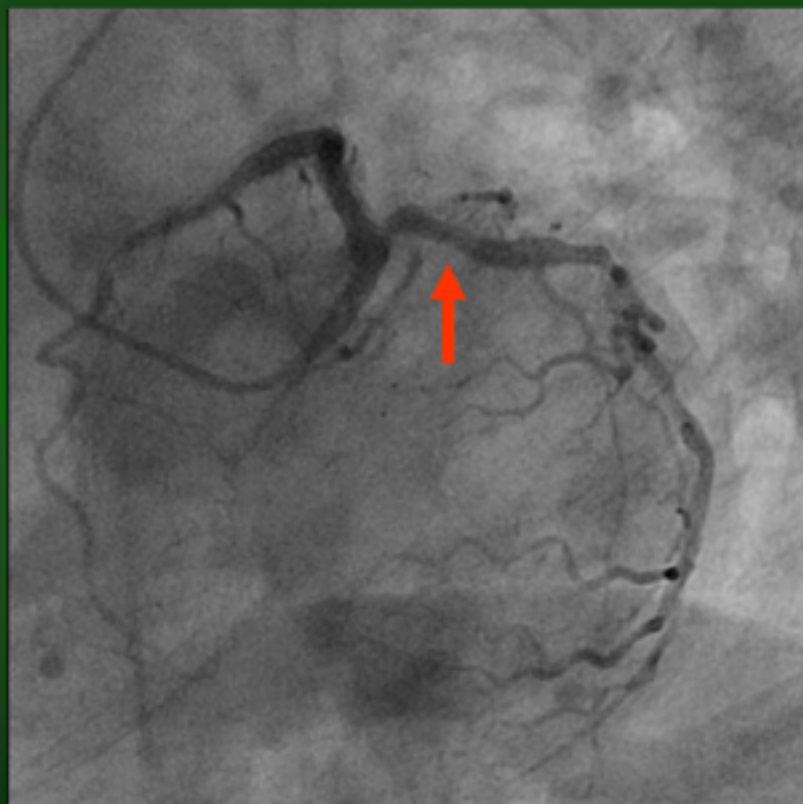

Cypher 3.5 × 23mm KBT

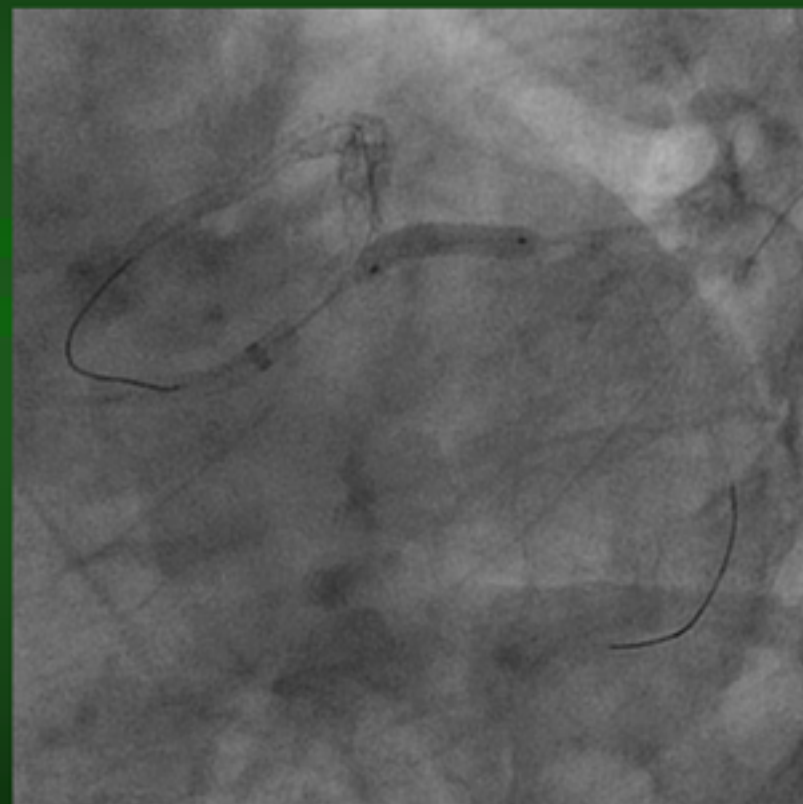

Post Procedure

## Restenosis and TLR Case for side branch

9Mo Follow-up

Re-PCI as T-Stenting

# Study Limitations

- Lesion selection bias (DCA catheter applicable)
- Small number patient enrolled
- Non-randomized fashion

## Conclusions

- DCA prior to DES stenting is safe and makes it possible to avoid complex stenting in lesions located at bifurcation.
- The interim Fu data looks **PERFECT** for main vessel and almost **PERFECT** for side branch.
- This strategy warrants further evaluation.
