

IVUS Guidance for DES Implantation to Treat LMCA Disease: Optimal Endpoints and Long-term Results

Soo-Jin Kang, MD., PhD.

University of Ulsan College of Medicine
Asan Medical Center, Seoul, Korea

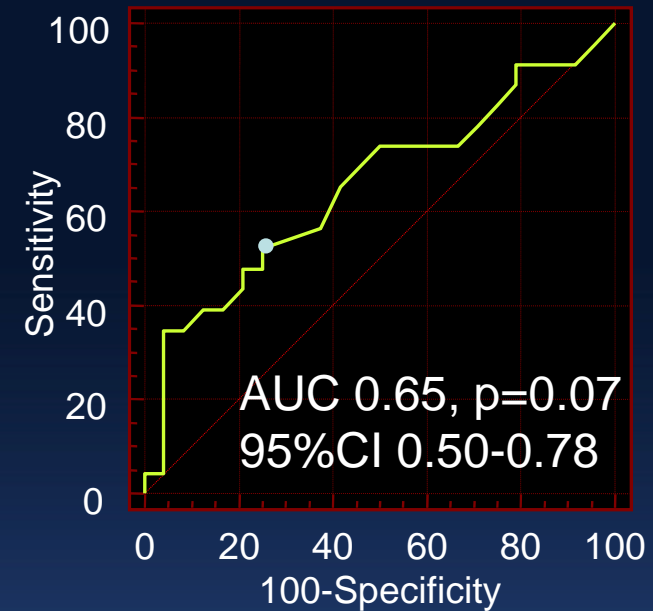

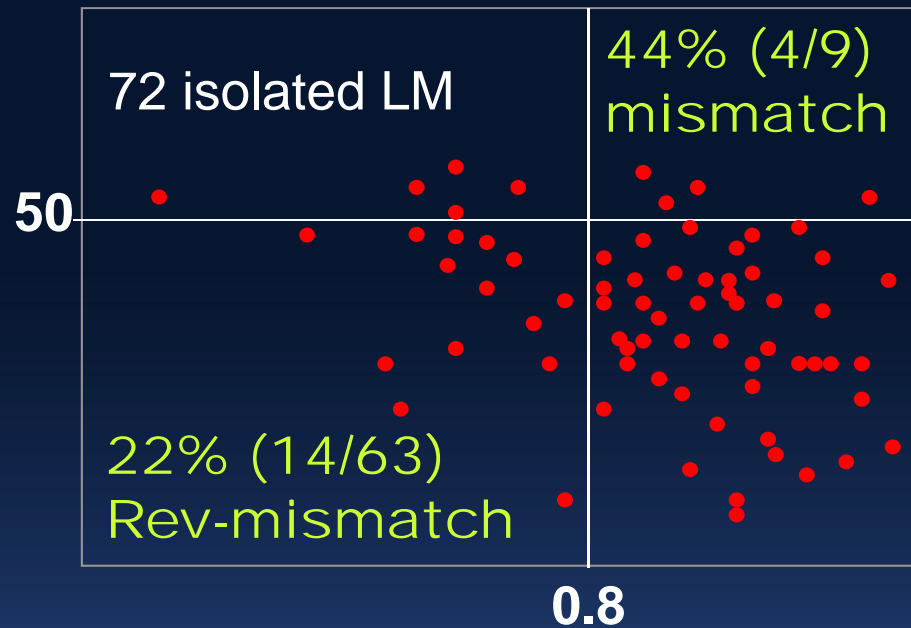

Disclosure

I have nothing to disclose

Issues of LM PCI

To Treat or Not to Treat?

QCA DS Poorly Predicts LM FFR

DS 50%

Sensitivity 26%
Specificity 92%
Accuracy 75%

DS 48%

Sensitivity 51%
Specificity 75%
Accuracy 65%

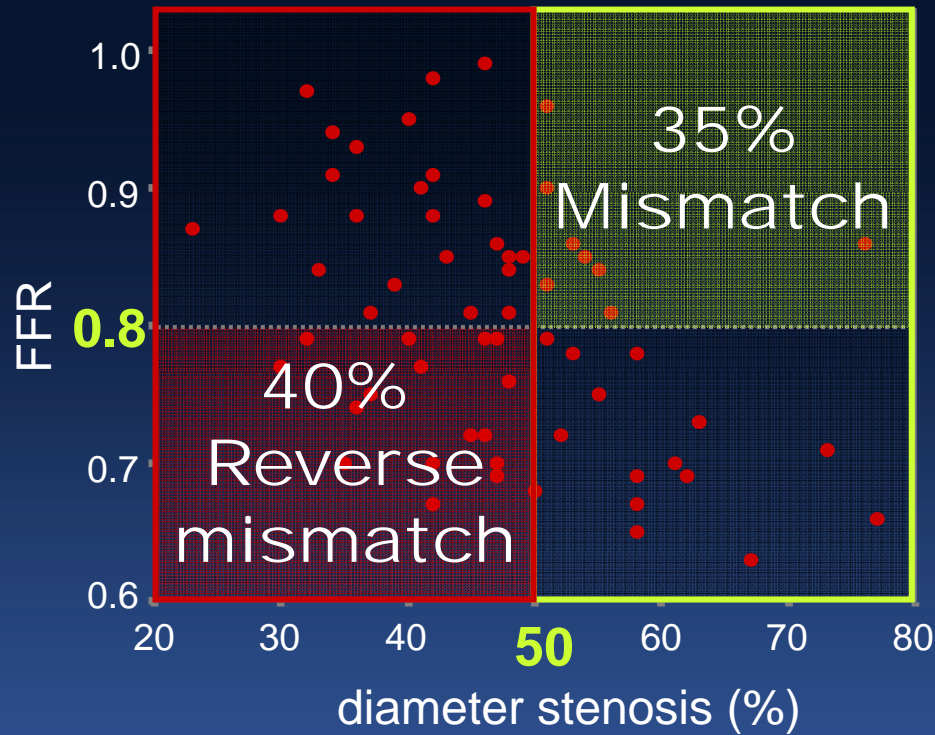

Hamilos et al. Circulation 2009;120:1505-12

AMC data

QCA-FFR Discordance

63 Isolated LM

1066 Non-LM

AMC data - ACC 2012

QCA-FFR Discordance in 1129 Lesions

- DS ≤ 50%, FFR ≥ 0.80
- DS > 50%, FFR < 0.80
- **Reverse-mismatch**
- Mismatch

- Relatively large myocardial territory of LM
- Angiographic underestimation of stenosis

AMC data- ACC 2012

Best IVUS Criteria To identify Functionally Significant LM Stenosis

MLA < 6.0mm² Predicts LM FFR<0.75

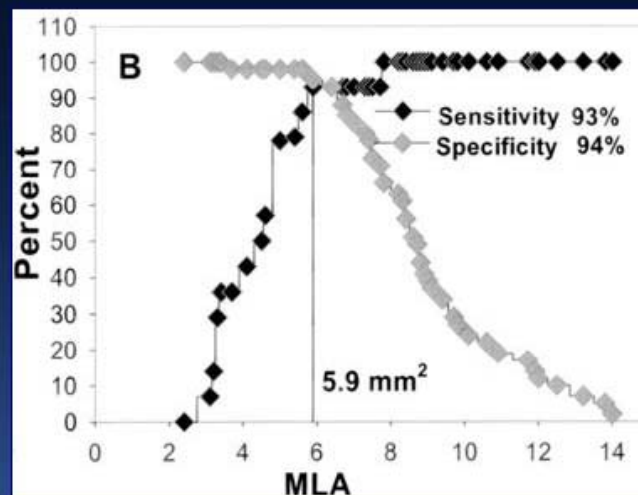

- Sum of lumen areas of two daughter vessels (Each of LAD and LCX should be 4.0mm²)= 150% of the parent LM
- Murray's Law ($LM\ r^3 = LAD\ r^3 + LCX\ r^3$)

Abizaid³

Jasti et al. Circulation 2004;110:2831-6

¹Circu

IVUS Predicting LM FFR < 0.80

Pure LM lesion of DS 30-80%
Exclude distal stream disease

MLA 4.8mm²

Sensitivity 89%

Specificity 83%

Accuracy 86%

Morphologic Simplicity

uniformly large vessel, short lesion length, lack of sidebranch

Kang et al. JACC Interv 2011;4:1168-74

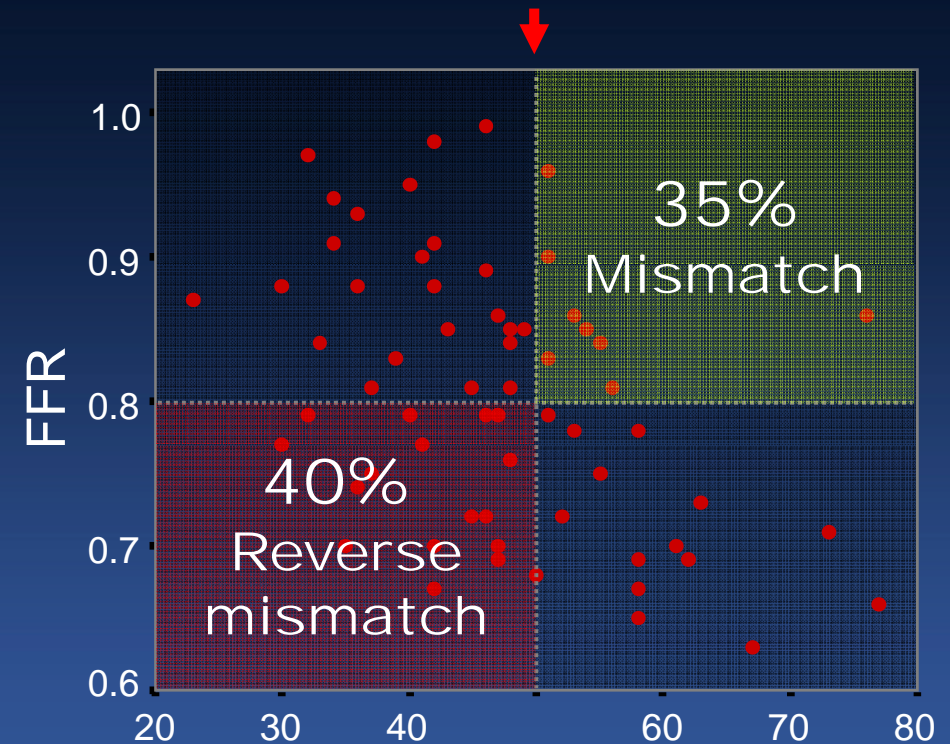

Visual-Functional Discordance in LM

IVUS-MLA 4.8mm^2

Accuracy 86%

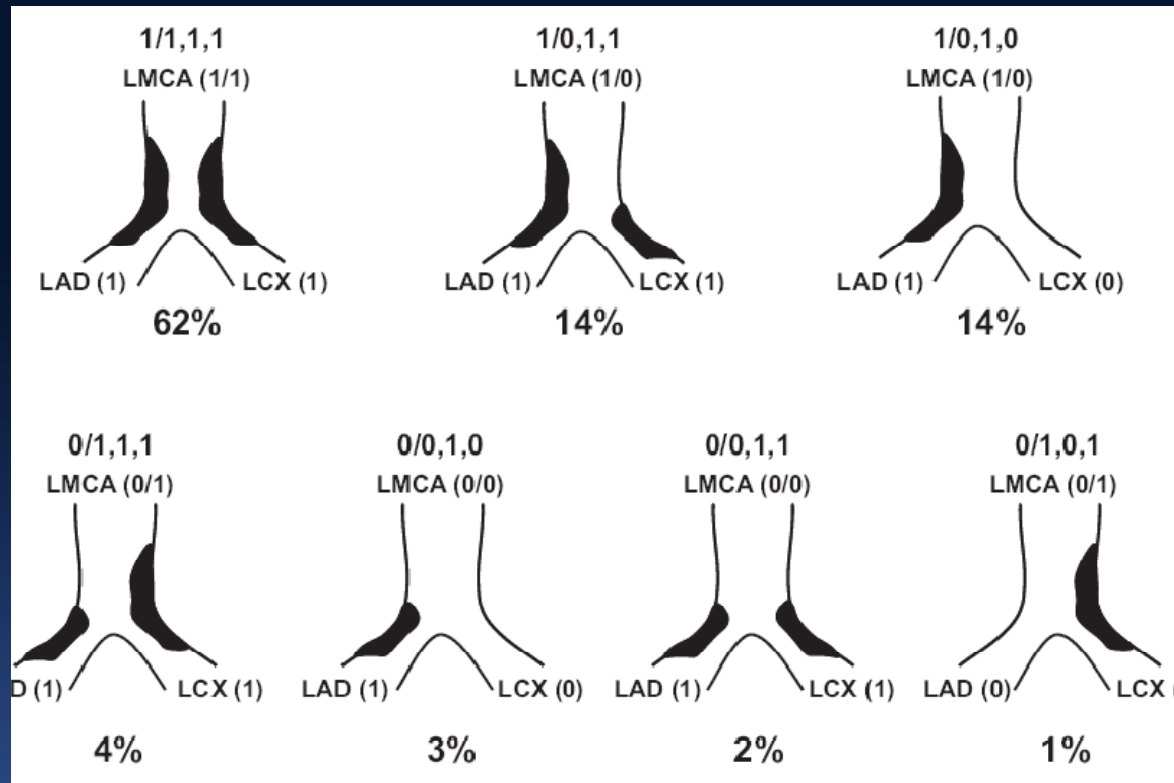

QCA-DS 50%

Accuracy 65%

More accurate morphologic information by IVUS

True Bifurcation Lesions in Majority...

Oviedo et al. Circ Cardiovasc Interv 2010;3:105-12

For LM true bifurcation, FFR measurement is necessary to decide to treat or not to treat

Issues of LM PCI

To Treat or Not to Treat?

Isolated LM

Os/Shaft Stent

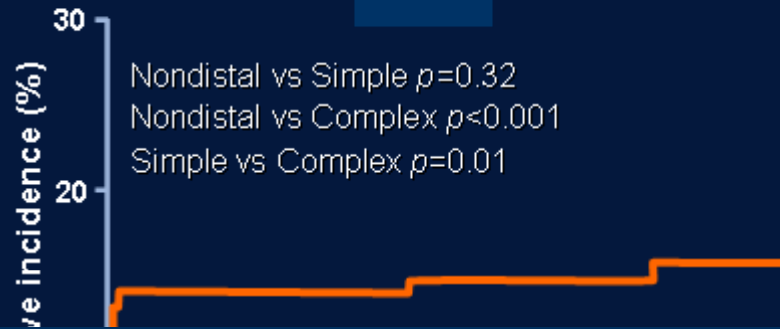

LM bifurcation

Stent Strategy?

Normal LCX os

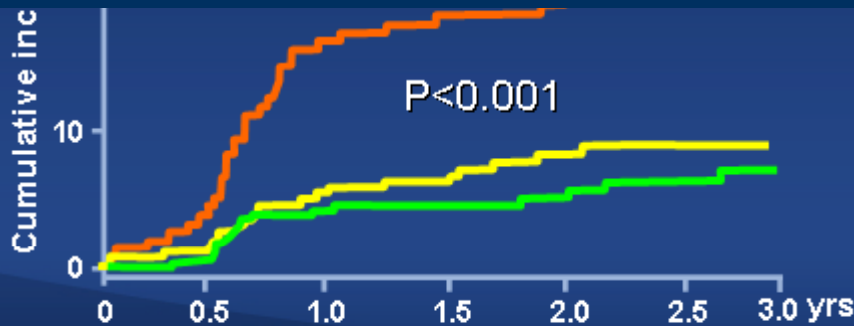

Diseased LCX

MI

- Complex 2 stents
- Non-distal (Ostial and Shaft)
- Simple (single stent cross over)**
In LM bifurcation lesions

Single Stent Cross Over is Clearly Better !

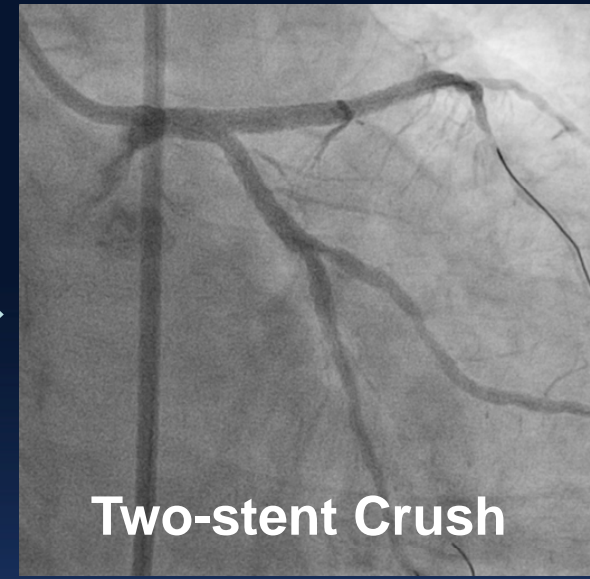

Stent Strategy for LM Bifurcation

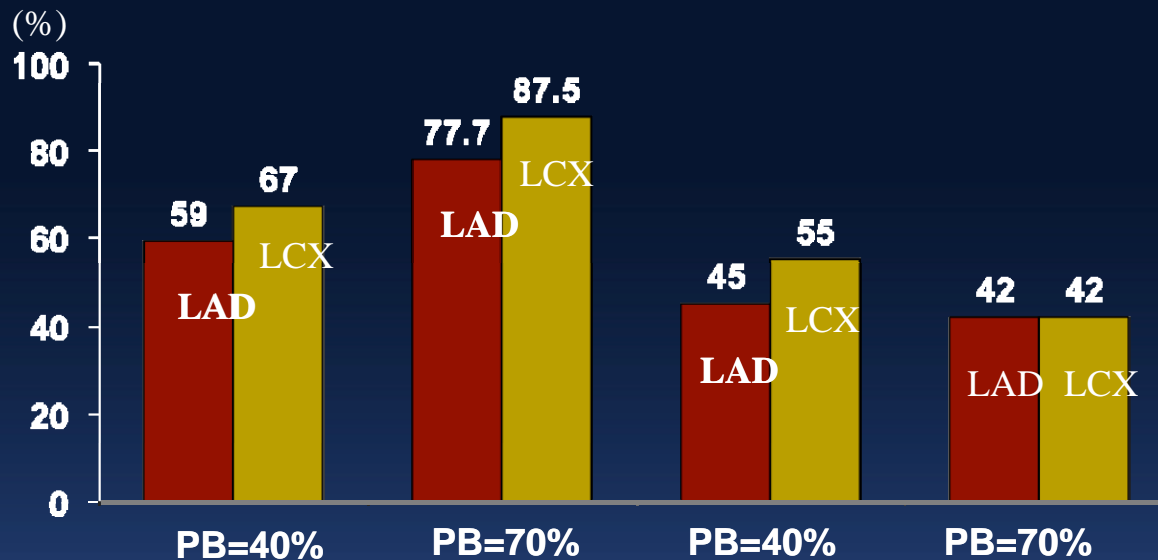

Single	<ul style="list-style-type: none">■ Normal ostial LCX (Medina 1.1.0., 1.0.0...)■ Small LCX with < 2.5 mm in diameter■ Diminutive LCX■ Normal or focal disease in distal LCX
Two	<ul style="list-style-type: none">■ Diseased LCX (Medina 1.1.1., 1.0.1...)■ Large LCX with ≥ 2.5 mm in diameter■ Diseased left dominant coronary system■ Concomitant diffuse disease in distal LCX

Because most have proximal LM disease, pre-PCI LCX-FFR is not reliable to assess LCX ostial disease

Disease Involvement of LCX Ostium

Plaque Burden of SB Ostium Measured by MB-Pullback is Only Moderately Reliable

Sensitivity

Specificity

Direct SB pullback is necessary for accurate assessment of LCX ostium

Oviedo et al. Am J Cardiol 2010;105:948-54

Issues of LM PCI

To Treat or Not to Treat?

Isolated LM

Os/Shaft Stent

LM bifurcation

Stent Strategy?

Normal LCX os

Diseased LCX

Single

How to Treat the Jailed SB?

Mechanism of LCX Compromise

Changes in Left Main Bifurcation Geometry After a Single-Stent Crossover Technique

An Intravascular Ultrasound Study Using Direct Imaging of Both the Left Anterior Descending and the Left Circumflex Coronary Arteries Before and After Intervention (n=23 LM bifurcation lesions)

MLA within LCX ostium

5.4mm²→4.0mm²

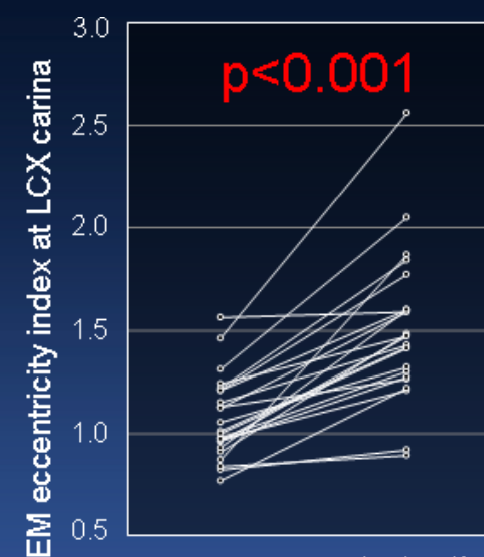

EEM area at MLA

11.8mm²→9.6mm²

EEM eccentricity

1.22→1.47

In a minority, plaque redistribution may be superimposed on carina shift to contribute to the further lumen loss at the ostial LCX

IVUS Cannot Predict LCX FFR

Plaque shift

MLA 4.5 mm²

FFR 0.85

Carina shift

MLA 3.8 mm²

FFR 0.91

Carina shift

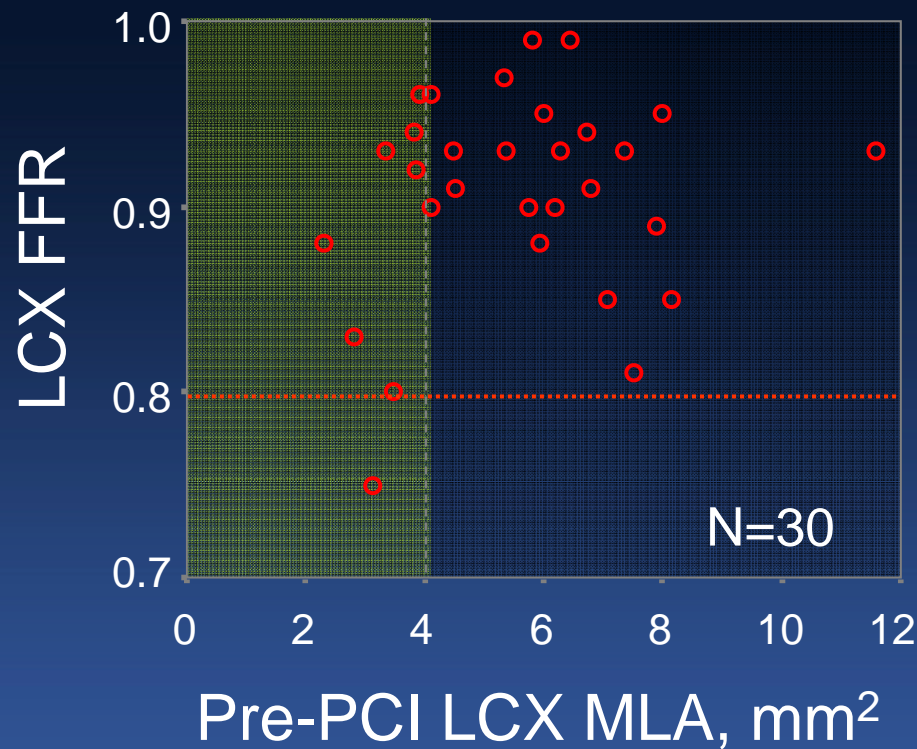

MLA 2.5mm²

FFR 0.81

Correlation between IVUS-MLA vs. Post-stenting FFR

*LM bifurcation with **LCX ostial DS <50%** pre-procedure*

AMC data, preliminary

Treatment for **Angiographically Jailed SB**

SB FFR >0.75 is safe for deferral in **non-LM disease**

No change in SB FFR ($0.87 \pm 0.06 \rightarrow 0.89 \pm 0.07$)
Functional restenosis (FFR < 0.75) in only 8%

Koo et al. Eur Heart J 2008;29:726–32

How to Optimize?

Comprehensive Intravascular Ultrasound Assessment of Stent Area and Its Impact on Restenosis and Adverse Cardiac Events in 403 Patients With Unprotected Left Main Disease

Between Mar 2003 - May 2009, 450 patients with LM disease underwent SES implantation and 9-mo angio surveillance

403 patients treated with SES implantation for LM
All had post-stenting IVUS and 9-mo angiography

Single-stent (n=289)

Non-bifurcation
(n=67)

Bifurcation with
Single-stent (n=222)

Two-stent (n=114)

Bifurcation with
Two-stent (*including 99
crushing, 15 T-stent*)

Kang et al. Circ Cardiovasc Interv 2011;4:1168-74

MSA 7.2mm²

Sensitivity 100%
Specificity 78%
Accuracy 80%

Optimal MSA *on a segmental basis*

Kang et al. Circ Cardiovasc Interv 2011 2011;4:1168-74

Frequency of Underexpansion and ISR

33.8% had underexpansion of at least one stented segment

Two-stent

54% had underexpansion in at least one of the 4 stented segments

Single-stent

27% had underexpansion in at least one of the 3 stented segments

* single-stent vs. two-stent, $p < 0.05$

Frequency of ISR in LM Lesions with vs. without Underexpansion

Overall lesions

Two-stent

-  Underexpansion of at least 1 segment
-  Adequate expansion at all sites

Kang et al. Circ Cardiovasc Interv 2011 2011;4:1168-74

Kaplan-Meier for MACE-free Survival

2-year MACE 4.8% at 23.8 ± 3.2 months (median 24 months)

A MACE

No. at risk

	0	6	12	18	24
Underexpansion (+)	133	131	126	121	75
Underexpansion (-)	260	260	255	246	129

B TLR

No. at risk
