Changing Guidelines on Myocardial Revascularisation

2014 ESC/EACTS Guidelines

Recommendations	Class ^a	Level ^b	Ref. ^c
FFR to identify haemodynamically relevant coronary lesion(s) in stable patients when evidence of ischaemia is not available.	I	A	50,51,713
FFR-guided PCI in patients with multivessel disease.	IIa	B	54
IVUS in selected patients to optimize stent implantation.	IIa	B	702,703,706
IVUS to assess severity and optimize treatment of unprotected left main lesions.	IIa	B	705
IVUS or OCT to assess mechanisms of stent failure.	IIa	C	
OCT in selected patients to optimize stent implantation.	IIb	C	

2018 ESC/EACTS Guidelines

UPGRADES		
For PCI of bifurcation lesions, stent implantation in the main vessel only, followed by provisional balloon angioplasty with or without stenting of the side branch		
Immediate coronary angiography and revascularization, if appropriate, in survivors of out-of-hospital cardiac arrest and an ECG consistent with STEMI		
Assess all patients for the risk of contrast-induced nephropathy		
OCT for stent optimization		
Recommendations	Class ^a	Level ^b
IVUS or OCT should be considered in selected patients to optimize stent implantation. ^{603,612,651–653}	IIa	B
IVUS should be considered to optimize treatment of unprotected left main lesions. ³⁵	IIa	B

Intravascular imaging for procedural optimization should be considered

The role of optical coherence tomography in the setting of acute myocardial infarction

Recent Activity

Choi OO (57/M)

Chief complaint: Effort angina (CCS Class II- 8month ago)

V/S: stable 2D-Echo: EF 71%, no RWMA

Treadmill test: High-risk (7.0 METs, 2mm down sloping STD on resting)

Initial coronary angiogram (Lt. snuffbox approach using 6 Fr. sheath)

Image-guided PCI for stent optimization in patient with LM disease

Significant stenosis in dLM bifurcation (Medina 1,0,0)

The factors for stent optimization

① appropriate stent selection

A: Distal Reference B: MLA site C: Proximal Reference

② Reference diameter

Aggressive	OCT	
		mm
▼	Smallest reference EEL	3.7
	Largest reference lumen	3.6
	Mean reference lumen	3.5
	Smallest reference lumen	3.3
▼	IVUS	
	EEL-to-EEL (lesion)	4.1
	Smallest reference EEL	4.0
	Mean mid-wall reference	3.8
	Largest reference lumen	3.5
	Mean reference lumen	3.4
Conservative	Smallest reference lumen	3.4

The factors for stent optimization (② appropriate post-stenting strategy)

Box 4 Criteria to assess optimal stent result

- A relative stent expansion of $>80\%$ (MSA divided by average lumen area) should be obtained in routine clinical practice.
- An MSA of $>5.5 \text{ mm}^2$ by IVUS and $>4.5 \text{ mm}^2$ by OCT should be achieved in non-left main lesions. **① MSA**
- The clinical relevance of acute malapposition is uncertain. Nonetheless, extensive malapposition after stent implantation should be avoided and corrected, if anatomically feasible. Early strut coverage may be promoted by full apposition.
- Acute malapposition of $<0.4 \text{ mm}$ with longitudinal extension $<1 \text{ mm}$ and **② Severe malapposition** with simultaneous neointimal integration is anticipated. This cut-off requires prospective validation.
- Late acquired malapposition represents an established cause of late and very late stent thrombosis.
- Tissue prolapse in ACS as compared with stable CAD is adversely related to outcomes, likely because of differences in the composition of the protruding tissue.
- Large dissections detected by IVUS or OCT are independent predictors of MACE. Presence of residual plaque burden, extensive lateral ($>60^\circ$), and longitudinal extension ($>2 \text{ mm}$) **③ Stent edge dissection** (distal) and localization distal to the stent increase the risk for adverse events.
- Stent edge haematoma may be detected by IVUS or OCT in case of angiographic appearance of a residual stent edge stenosis.

Expert consensus of the EAPCI, Eur Heart J May 16, 2018

Expert consensus of the EAPCI, Eur Heart J May 16, 2018

- The choice of IVUS or OCT is just depend on how familiar it is with operator
- Important thing is that **we are planning to image-guided PCI!!!**

Initial coronary angiogram

(Lt. snuffbox approach using 6 Fr. sheath)

Angiographically healthy of os-LCx

Assessment of LM to pLAD lesion with IVUS

pLAD with D1 & Septal br. (trifurcation)

pLAD (healthy)

pLM (healthy)

just dLM

os-LCx

OCT-guided PCI for distal LM lesion

(Lt. snuffbox approach using 6 Fr. sheath)

Contrast: 4cc/s, 16cc/4s, 250 PSI

Pre-OCT pullback image

Distal landing zone

Minimal Lumen Area

Proximal landing zone

Diffuse fibroatheroma including both landing zones
(fibroatheroma = vulnerable plaque = lipid core plaque = necrotic core)

OCT-guided PCI for distal LM disease

(Lt. snuffbox approach using 6 Fr. sheath)

3.76 mm in DRD & 4.26 mm in PRD

3.5 x 18mm Xience Alpine

3.5 x 18mm Xience @ 16 atm (3.75mm)

OCT-guided PCI for distal LM disease

(Lt. snuffbox approach using 6 Fr. sheath)

3.76 mm in DRD & **4.26 mm** in PRD

FU OCT pullback

4.0 x 10mm NC balloon @ upto 22 atm (4.26mm) in the prox. portion of stent

Contrast: 4cc/s, 20cc/5s, 300 PSI

Successful OCT-guided PCI for distal LM disease

Final CAG

Hemostasis for 3 hours

Park OO (59/M)

- Intermittent resting chest pain 1 day ago
- No complaining of chest pain at ER
- Known HTN and dyslipidemia
- Hx of PCI due to STEMI 3 years ago
- Changing DAPT (ASA + CLO) into SAPT (ASA) 4 month ago
- Initial Tnl: 9.2 ng/dL
- ECG: No ST-segment deviation
- Ticagrelor 180mg loading before PCI

Urgent coronary angiography

IVUS or OCT guidance for stent optimization?

2014.06.23
4.5x16mm BMS in pRCA

2017.08.03
Patency of stent in pRCA
Severe stenosis in ectatic dRCA

OCT-guidance would be safe in patients with AMI?

- 1)TIMI flow:
- 2)STD on the ECG:
- 3)Chest pain:

My strategy regarding stent optimization

- ① A selection of 4.0 x 24mm DES
- ② Stent deployment with high pressure
- ③ 5.0mm NC balloon inflation with high pressure in distal stent including stent edge

OCT-guided PCI for stent optimization in AMI patient with ectatic coronary artery

Predilation with 3.0x15mm balloon at 10atm (3.08mm)

DES 4.0x24mm @ 16atm (4.48mm)

Sequential postdilation with a 5.0 NC balloon

OCT-guided PCI for stent optimization in AMI patient with ectatic coronary artery

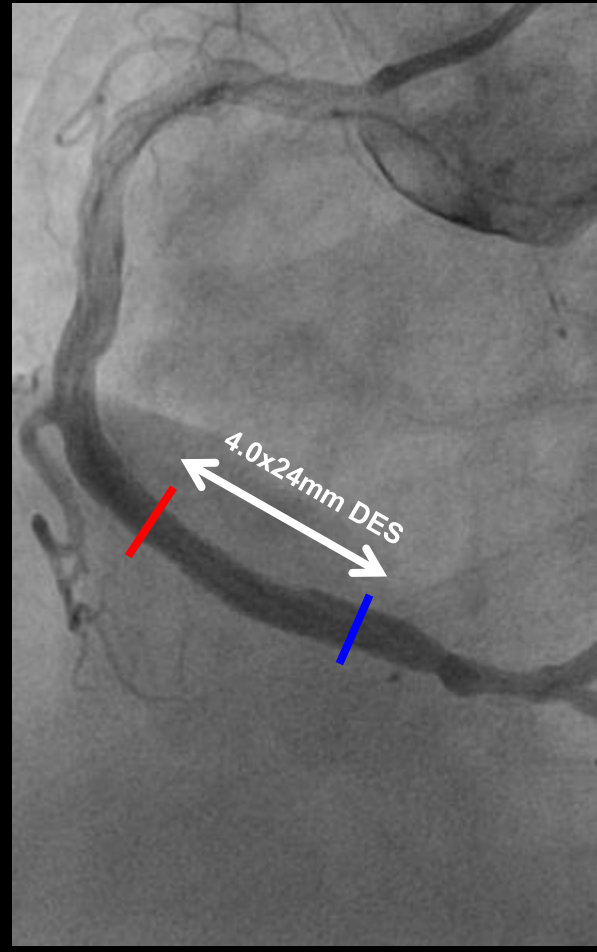

Initial Strategy

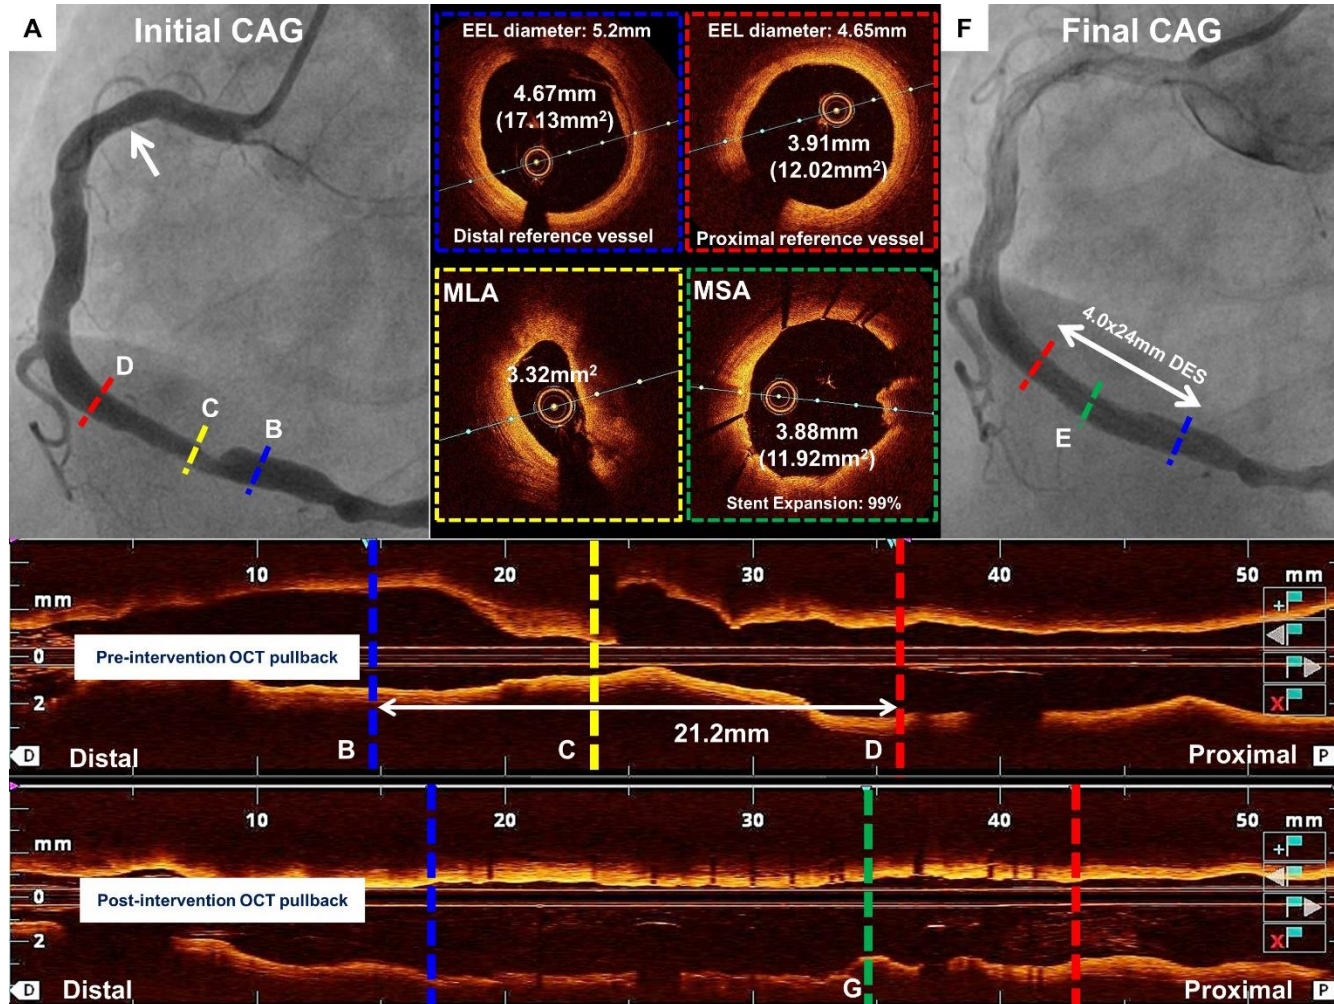

Final Result

Optimal drug-eluting stent implantation with the aid of optical coherence tomography in the stenotic lesion of ectatic coronary artery

Assessment for ambiguous angiographic finding in patient with acute myocardial infarction by optical coherence tomography

Yongcheol Kim, Myung Ho Jeong, Min Chul Kim, Doo Sun Sim,
Young Joon Hong, Ju Han Kim, Youngkeun Ahn

Division of Cardiology, Chonnam National University Hospital, Gwangju, Korea

A 72-year-old man with history of treated hypertension, presented with sudden onset of chest pain at rest and evidence of minimal ST-segment elevation in the inferior electrocardiogram leads. Urgent coronary angiography (CAG) demonstrated the diffuse mild stenosis from distal right coronary artery (RCA) to posterolateral branch (Fig. 1A).

The non flow-limiting nature of the lesion and the suspicious RCA, potentially a culprit lesion, led to assessment with optical coherence tomography (OCT). OCT demonstrated false lumen with intramural hematoma between distal RCA and posterolateral branch and folding of the luminal intimal contour at distal RCA (Fig. 1 — B1, C1).

Take Home Message

- **If IVUS can do it, OCT can do it as well**
(Except for very limited cases such as os-LM disease or TIMI flow ↓)
- **Especially, OCT can give precise information to stent optimization in the setting of stent failure and dilated coronary artery.**
- **OCT can be useful tool for evaluation of ambiguous angiographic finding.**
- **Do not think of OCT as a research tool anymore.**

Thank you for your attention
