New York City, NY**

Disclosure Statement of Financial Interest

Within the past 12 months, I or my spouse/partner have had a financial Interest /arrangement or affiliation with the organization(s) listed below

Affiliation/Financial Relationship

Company

Grant/ Research Support:

Boston Scientific Corp.

Consultant:

Boston Scientific Corp.

Speaker Fee:

St Jude Medical, Volcano Corporation

Unstable Plaque=Causing Thrombosis

Plaque Rupture

Plaque Erosion

Calcified Nodule

Stable Plaque=Not Causing Thrombosis

Fibrocalcific Plaque

Healed Rupture

Pathological Intimal Thickening

NIR can Distinguish Lipid-rich from Fibrotic Plaques

IVUS
DIAMETER

CHEMOGRAM

IVUS
DIAMETER

CHEMOGRAM

NIR Spectroscopy

- Necrotic Core $>0.2\text{mm}$ thick, $>60^\circ$, Cap $<0.45\text{mm}$

Process of NIR Spectroscopy

1. What kind of tissue?

Tissue

2. Near Infrared

Tissue

3. Absorption Pattern from this tissue

4. How similar?

5. Probability for Necrotic Core

XX%

Formation of the Chemogram LCP Prediction

Spectra acquired at discrete pullback and rotation positions

Spectra transformed into posterior probability of LCP

Probability mapped to a color

Pixels formed into an image

Formation of the Cap Thickness Prediction Image

Spectra acquired at discrete pullback and rotation positions

LCP Spectra transformed into posterior probability of thin cap presence

0→1

Probability mapped to a color

Pixels formed into an image

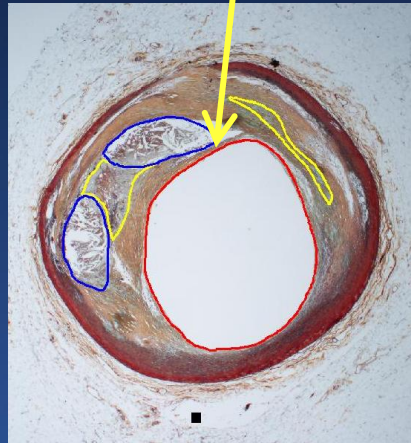

52mm

42mm

28mm

6mm

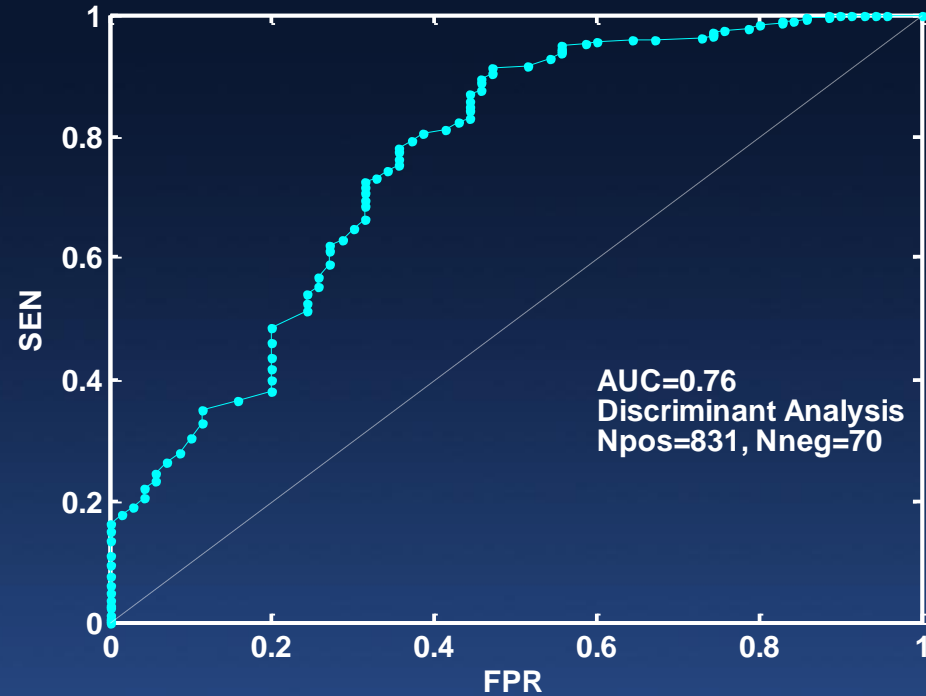

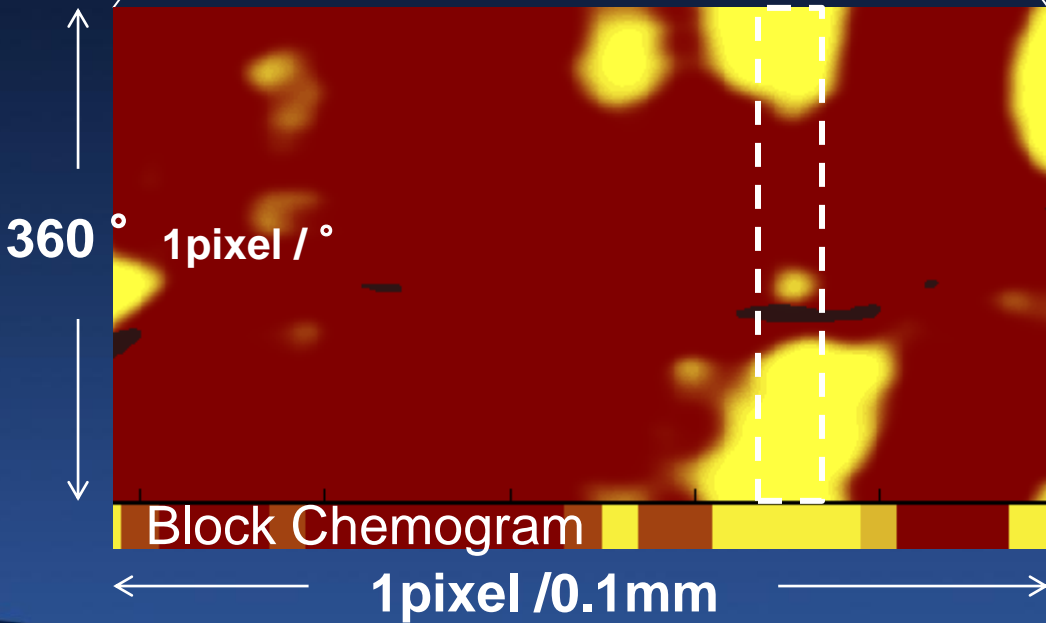

Ability to Predict Thin Cap (<0.065mm)

Capmeth=min, Neg=Cap<0.065mm,
Pos=Cap>0.065mm, CapTypes=[LCNCCC]

Capmeth=min, Neg=Cap<0.065mm,
Pos=Cap>0.065mm, CapTypes=[LCNCCC]

Lipid core burden index

- Lesion LCBI
 $= 28499 / 178923 * 1000 = 159$
- Max_{4mm} LCBI
 $= 8515 / 13951 = 610$

Is there a characteristic signal of lesions that cause STEMI?

Near infrared spectroscopy (InfraReDx) was performed immediately after infarct artery recanalization in 20 pts with STEMI

The NIRS chemograms of all 20 STEMI pts. The culprit segments contain LCP in 19 cases (95%), all with large plaque burden.

Is there a characteristic signal of lesions that cause STEMI?

Near infrared spectroscopy (InfraReDx) was performed immediately after infarct artery recanalization in 20 pts with STEMI

Ability of NIRS (maxLCBI_{4mm}) and IVUS (plaque burden and calcification) to distinguish the culprit segment from non-culprit segments of the STEMI culprit vessel:

- AUC for maxLCBI_{4mm} = 0.90
- AUC for plaque burden = 0.86

Relationship between Lipid Rich Plaque detected by NIRS and Outcomes

- Prospective Single Center Study, 206 patients (ACS47%)
- Primary Endpoint: Composite of all-cause mortality, non-fatal ACS, stroke and unplanned PCI during one-year FU
 - >40mm non culprit segment of NIRS

Lipid Core
Burden Index
(LCBI)=188

Relationship between Lipidic Plaque detected by NIRS and Outcomes

Primary endpoint

- LCBI ≥ median
- LCBI < median

No. at Risk

LCBI < Median	101	99	99	97	91
LCBI ≥ Median	102	94	92	86	83

Adjusted HR: **4.04** 95% CI: 1.3-12.3 P=0.01

PROSPECT: Non-FA Lesions

Number at risk

Non-FA group	67	62	61	61	60	57	29
FA group	542	485	463	443	424	406	248

**Two/Three Vessel CAD
(n= 87)**

**After stenting the target vessel
The non-target lesion underwent FFR**

FFR \leq 0.8 \rightarrow IVUS, NIRS

**Follow up Cath (6-8 weeks)
FFR, IVUS and NIRS repeated.
If FFR \leq 0.8, lesion stented and imaging repeated.
If FFR > 0.8 the patient was treated medically.**

**Imaging data analyzed by CRF Core Lab
Data analysis for primary outcome analyzed by MSH independent Core Lab**

*Optimal medical therapy for all patients

Case Example

Yellow

Baseline

Plaque Area
5.6mm²

Lesion LCBI: 259
 ←————→
 Max10mm LCBI: 511
 ←————→
 Max4mm LCBI: 802
 ↔

Follow-up

Plaque Area
5.5mm²

Lesion LCBI: 177
 ←————→
 Max10mm LCBI: 289
 ←————→
 Max4mm LCBI: 474
 ↔

Paired Analysis – Lesion LCBI

Yellow

Variable	Standard (n = 43)	Aggressive (n = 44)	P
Percent atheroma volume	0.26%	0.24%	0.98

PROSPECT II Study

**900 pts with ACS at up to 20 hospitals
in Sweden, Denmark and Norway (SCAAR)**

NSTEMI or STEMI $>12^{\circ}$

IVUS + NIRS (blinded) performed in culprit vessel(s)

Successful PCI of all intended lesions (by angio \pm FFR/iFR)

Formally enrolled

3-vessel imaging post PCI

Culprit artery, followed by non-culprit arteries

Angiography (QCA of entire coronary tree)

IVUS + NIRS (blinded) (prox 6-8 cm of each coronary artery)

PROSPECT: Correlates of Non-Culprit Lesion Related Events

Impact of plaque burden

PROSPECT II Study

PROSPECT ABSORB RCT

900 pts with ACS after successful PCI

3 vessel IVUS + NIRS (blinded)

≥1 IVUS lesion with ≥70% plaque burden present?

Yes

(N=300)

No

(n=600)

R

2:1

**ABSORB BVS
+ GDMT** (N~200)

GDMT
(N=100)

Routine angio/3V IVUS-NIRS FU at 2 years

Clinical FU for ≥3 years

PROSPECT II Study

PROSPECT ABSORB RCT

- Primary endpoints and analysis -

PROSPECT II

Endpoints: Composite MACE (cardiac death, cardiac arrest, MI, or unstable or progressive angina requiring rehospitalization or revascularization) adjudicated to non-culprit lesions

Analysis: Multivariable predictors, including clinical, QCA, IVUS and NIRS (patient and lesion level)

PROSPECT ABSORB

Endpoints and analysis: IVUS MLA at 2 years (superiority, powered); Death, TV-MI, TLR (noninferiority, not powered)

Summary

- 1. Algorithm was validated for lipid rich plaque (LRP) and show the distribution of LRP.**
- 2. Algorithm for thin cap fibroatheroma seems to have good probability and will be available soon.**
- 3. NIRS shows good reproducibility and robust for evaluation of evolution of LRP.**
- 4. NIRS seems to have high negative predictive value for stable plaque and clinical impact of positive prediction will be answered in PROSPECT2.**
