

**Targeted Adjustable Pharmaceutical  
Application System (TAPAS) Catheter  
Assisted Thrombolysis in Cirrhotic  
Patient Contraindicated For Thrombolysis  
First in Man Case Report**

**Chung-Ho Hsu, M.D.**

**Interventional cardiologist**

**Director of PAD Team**

**China Medical University Hospital, Taichung,  
Taiwan, R.O.C.**

**TAPAS catheter (Thermopeuti X, Inc., San Diego, CA, USA)**

# History

- 82 y/o woman
- HCVD, DM, IHD, liver cirrhosis, HBV related, Child C (hypoalbuminemia, ascites, hepatic hydrothorax, hepatic encephalopathy, coagulopathy, splenomegaly with thrombocytopenia, EV), chronic renal insufficiency, peptic ulcer disease
- Bilateral legs edema, especially right side for two weeks

- D-dimer 2800 (cutoff value < 500) Plt 85000/uI  
Prothrombin time (INR 1.5-2.1), Cr 1.8 md/dl
- Echo: DVT over right proximal femoral vein
- Start heparin pump but in vain (aPTT 50-60 sec), later DC due to black color stool, high risk of bleeding, stool OB 1+

# Ultrasound

Thrombus over right common and proximal superficial femoral vein

# PTA

**7Fr sheath, Retrievable G2X IVC Filter**

6Fr JR4 catheter,  
.035" Terumo wire

8Fr Cook Crossover sheath

TAPAS catheter, Heparin 5000 units, urokinase 240000 units

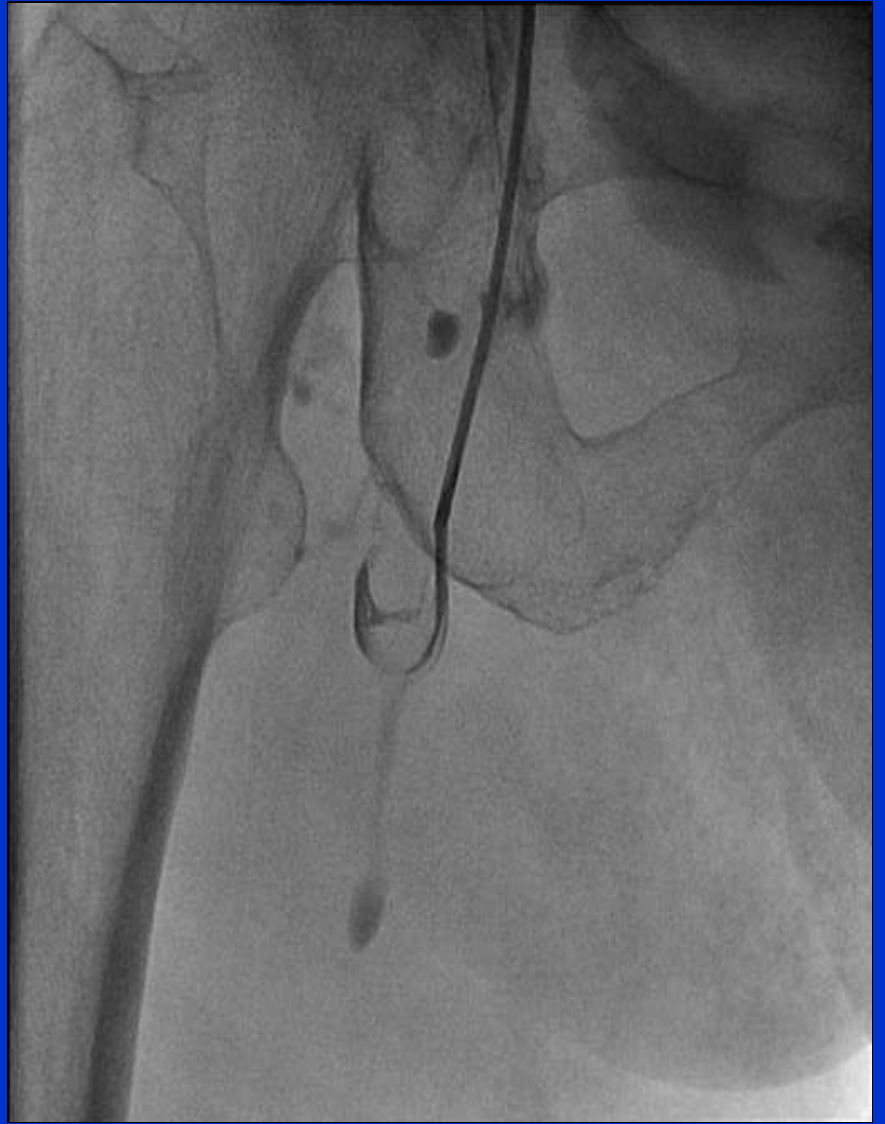

Balloon fragmentation with 8.0 x 40 mm Admiral Balloon at 6 atm

CMUH

Urokinase 240000 units

Balloon fragmentation with x 12.0/40  
mm Admiral Balloon at 6 atm

CMUH

8Fr RESS guiding catheter for thrombus suction

# After PTA

- Right leg edema resolved in one day
- No bleeding event was noted

# Conclusion

- For patient with DVT who is contra-indicated for anticoagulation and thrombolysis, what can we do is little in the past... maybe just set IVC filter with close observation
- TAPAS infusion balloon catheter directed thrombolysis can be applied safely without bleeding complication
- It's a first in man case report. We need large trial to prove the efficacy and safety of this approach
