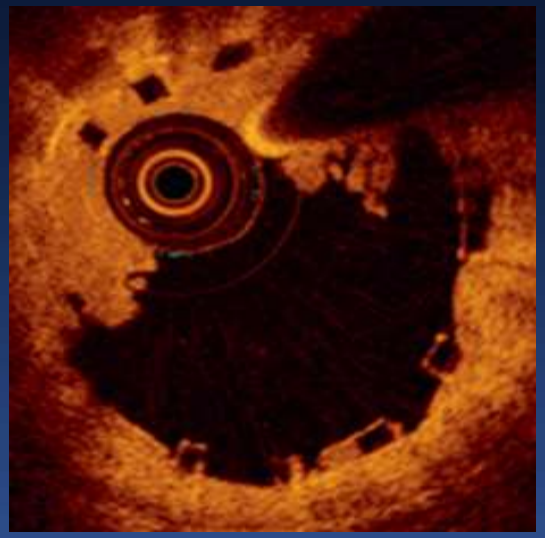
Target vessel	8.7% (76)	7.5% (65)	1.16 (0.84–1.62)	0.37
Target lesion	7.0% (60)	5.2% (45)	1.33 (0.90–1.96)	0.15
Device thrombosis	3.0% (26)	0.6% (5)	5.19 (1.99–13.50)	<0.001
Device stenosis	4.1% (35)	4.6% (40)	0.87 (0.55–1.36)	0.53

Joanna J. Wykrzykowska et al, NEJM 2017; March 29, 2017DOI: 10.1056/NEJMoa1614954

Main Issue

1. Rate of any death or cardiac death were not different.
2. Rate of Peri-MI and spontaneous MI were higher in BVS group at follow-up.
3. Scaffold VLST continues to occur at 1-3 years follow-up !

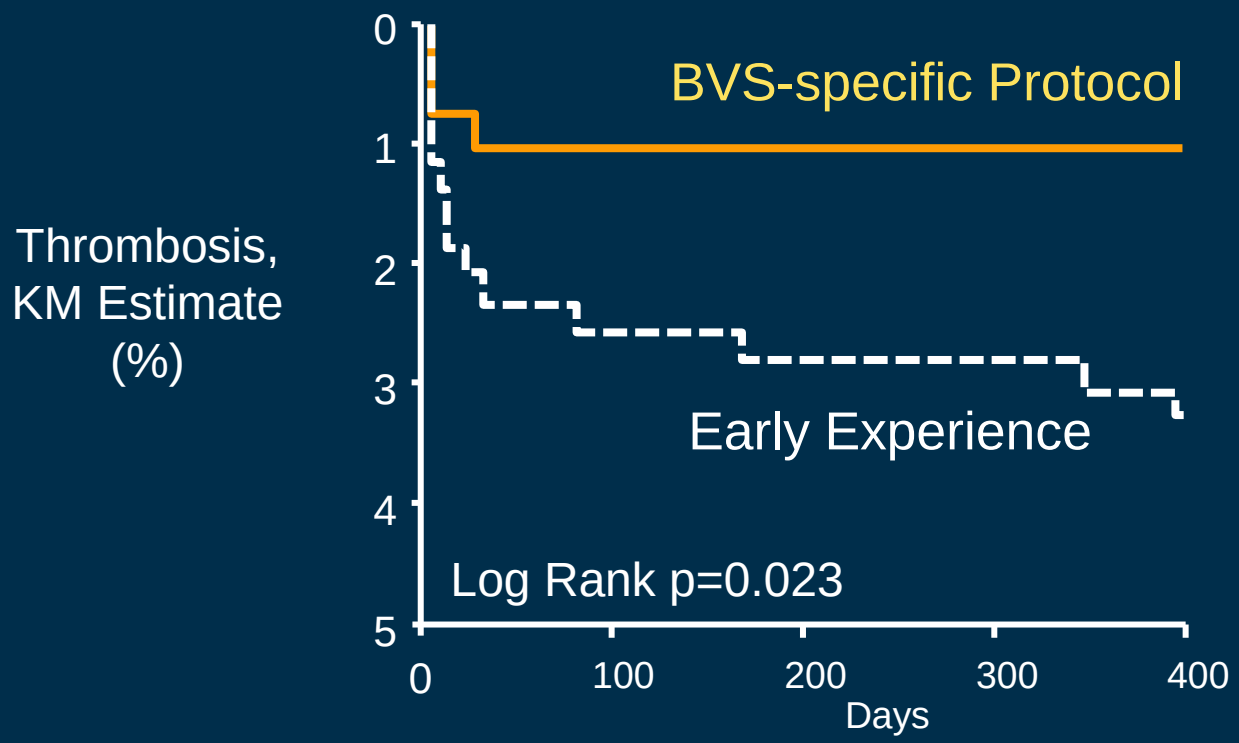
Main Issue Is,
Scaffold Thrombosis



We have to consider that Scaffold thrombosis is mainly related how to deploy the BVS (PSP) !

Why ?

BVS-Specific Protocol Reduced BVS Thrombosis



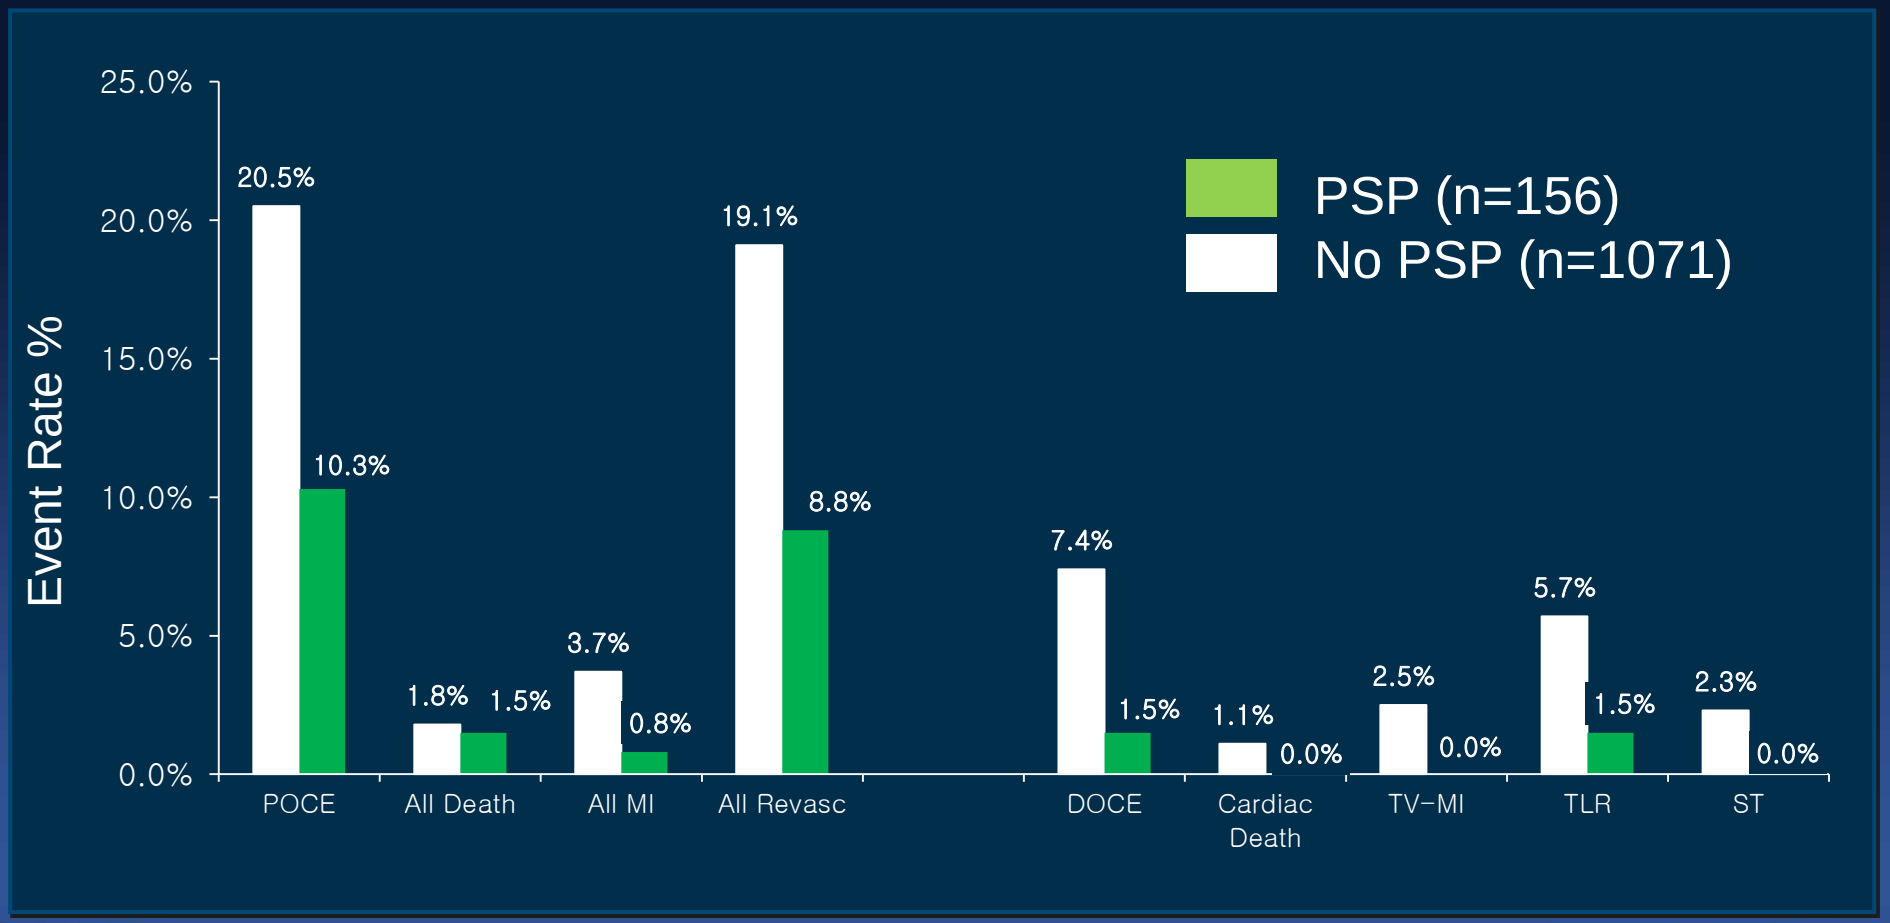
Patients					
Early Experience	369	369	369	369	369
Absorb–specific	292	292	281	217	155

Puricel, S. et l. J Am Coll Cardiol. 2016; 67(8):921–31

BVS Specific Recommended Technique (PSP)

Puricel, S. et l. J Am Coll Cardiol. 2016; 67(8):921–31,
4 German and Swiss centers -BVS specific protocol

Significant Improvement of Outcomes
In GHOST-EU At 1 Year *With Completed PSP*



Brugaletta, S., GHOST-EU PSP Analysis, TCT 2016.

Korea	Bundang Cha Medical Center, Bundang	Sang Wook Lim
Korea	Hallym University Medical Center	Hyun Sook Kim

Primary End Point

Target-Vessel failure (TVF)

a composite clinical outcomes of

- Cardiac Death
- Myocardial Infarction
  - Periprocedural MI: CK-MB > 10 times UNL
  - Spontaneous MI: any cardiac enzyme elevation
- Target-Vessel Repeat revascularization

Baseline Characteristics

Variable	IRIS-BVS (N=352 patients)
Age	60.6 ± 10.0
Male	281 (79.8%)
BMI	25.1 ± 2.9
Current smoker	88 (25.0%)
Diabetes Mellitus	97 (27.6%)
Insulin-treated	8 (2.3%)
Hyperlipidemia	269 (76.4%)
Hypertension	194 (55.1%)
Family history of CAD	27 (7.7%)
History of PCI	28 (8.0%)
History of CABG	3 (0.9%)
History of renal disease	2 (0.6%)
Stable angina or silent ischemia	282 (80.1%)
ACS at presentation	70 (19.9%)
LVEF	62.8 ± 6.1
LVEF <40%	2 (0.7%)

Procedural Characteristics

	Patient-based (N=352)	Lesion-based (N=394)
Target vessel		
LMCA		3 (0.8%)
LAD		237 (60.2%)
LCX		110 (27.9%)
RCA		44 (11.2%)
Lesion type		
A		12 (3.0%)
B1		101 (25.6%)
B2		52 (13.2%)
C		229 (58.1%)
Moderate to severe calcification in QCA		45 (11.4%)
Chronic total occlusion	12 (3.4%)	5 (1.3%)
Bifurcated lesion	198 (56.2%)	206 (52.3%)
Thrombus present	1 (0.3%)	2 (0.5%)
Multi-vessel disease	101 (28.7%)	

Procedural Characteristics

	Patient-based (N=352)	Lesion-based (N=394)
PSP	**99%**	
Received both BVS and DES	60 (17.0%)	
Total number of scaffolds	1.5 ± 0.9	1.2 ± 0.4
Total scaffold length (mm)	30.6 ± 18.8	27.0 ± 12.1
Average scaffold diameter (mm)	3.3 ± 0.3	3.3 ± 0.3
Scaffold diameter (N=512)		
2.5 mm	27 (5.3%)	
3.0 mm	178 (34.8%)	
3.5 mm	307 (59.9%)	
Intravascular ultrasound use	327 (92.9%)	
Optical coherence tomography	41 (11.6%)	

Lesion Characteristics (AMC data)

Variable	QCA-based (N=275 lesion)	IVUS-based (N=247 lesion)
Lesion length (mm)	21.1 ± 11.6	24.4 ± 9.9
Long lesion (Lesion length >40 mm)	12 (5.4%)	9 (7.2%)
Proximal RVD (mm)	3.5 ± 0.5	4.4 ± 0.6
Distal RVD (mm)	2.6 ± 0.4	3.7 ± 0.6
Proximal RVD <2.5 mm	7 (2.5%)	0 (0.0%)
Distal RVD <2.5 mm	107 (38.9%)	6 (2.4%)
Interpolated normal reference (mm)	3.0 ± 0.4	
Minimal lumen diameter (mm)	1.2 ± 0.5	1.7 ± 0.3
Diameter Stenosis (%)	59.8 ± 15.3	
Minimal lumen area (mm^2)		2.4 ± 0.8
Proximal reference vessel area (mm^2)		15.7 ± 4.1
Distal reference vessel area (mm^2)		10.9 ± 3.9
Calcification observed in IVUS		209 (84.6%)
Plaque burden at MLA site (%)		78.4 ± 7.8

Procedural Characteristics (AMC data)

Variable	QCA-based (N= 211 lesion)
Pre-dilation using NS balloon	199 (94.3%)
Post-dilation using NC balloon	109 (99.1%)
Post-dilation, Pressure (atm)	19.5 ± 5.3
Final balloon diameter (mm)	3.6 ± 0.3
Final scaffold diameter (mm)	3.5 ± 1.9
Balloon to artery Ratio of proximal RV	1.06 ± 0.14
Balloon to artery Ratio of distal RV	1.37 ± 0.40
Mean Balloon to artery Ratio	1.22 ± 0.30
Mean inflation time (sec)	25 + 12
Absolute difference of final scaffold diameter compare to QCA proximal RVD (mm)	0.2 ± 0.5
Absolute difference of final scaffold diameter compare to QCA distal RVD (mm)	0.8 ± 1.9

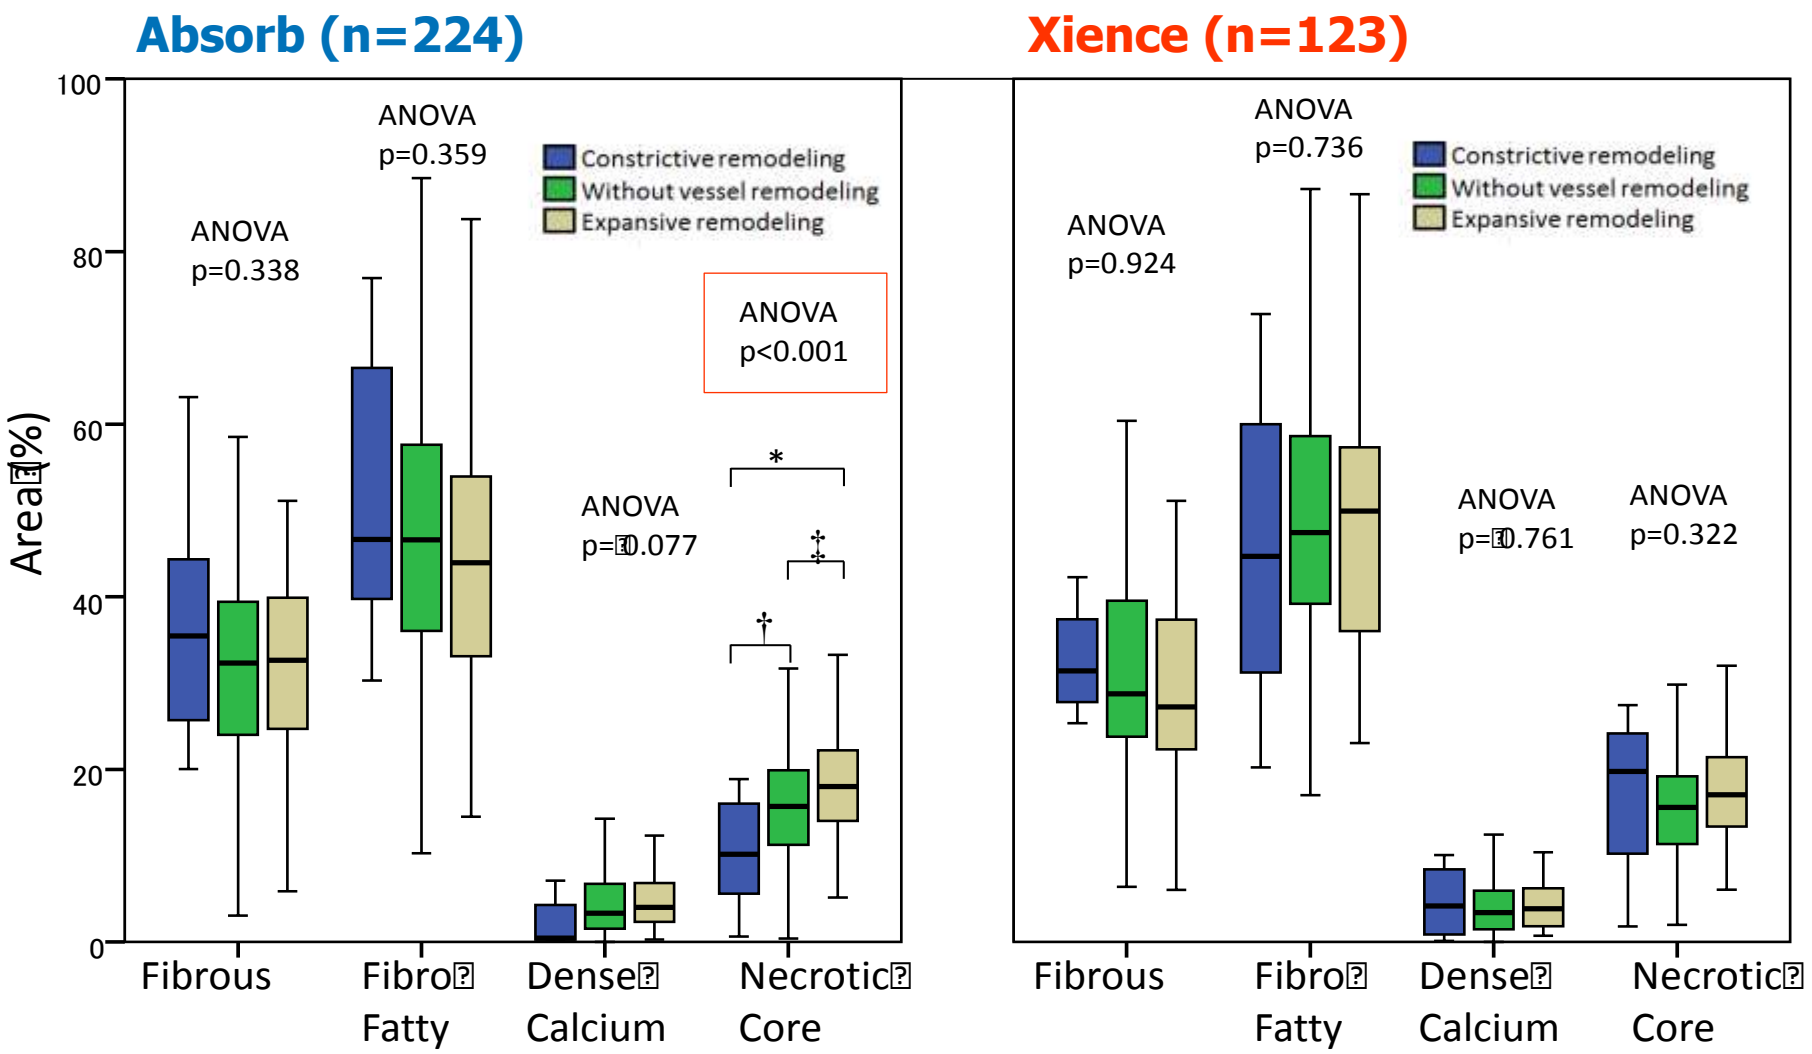
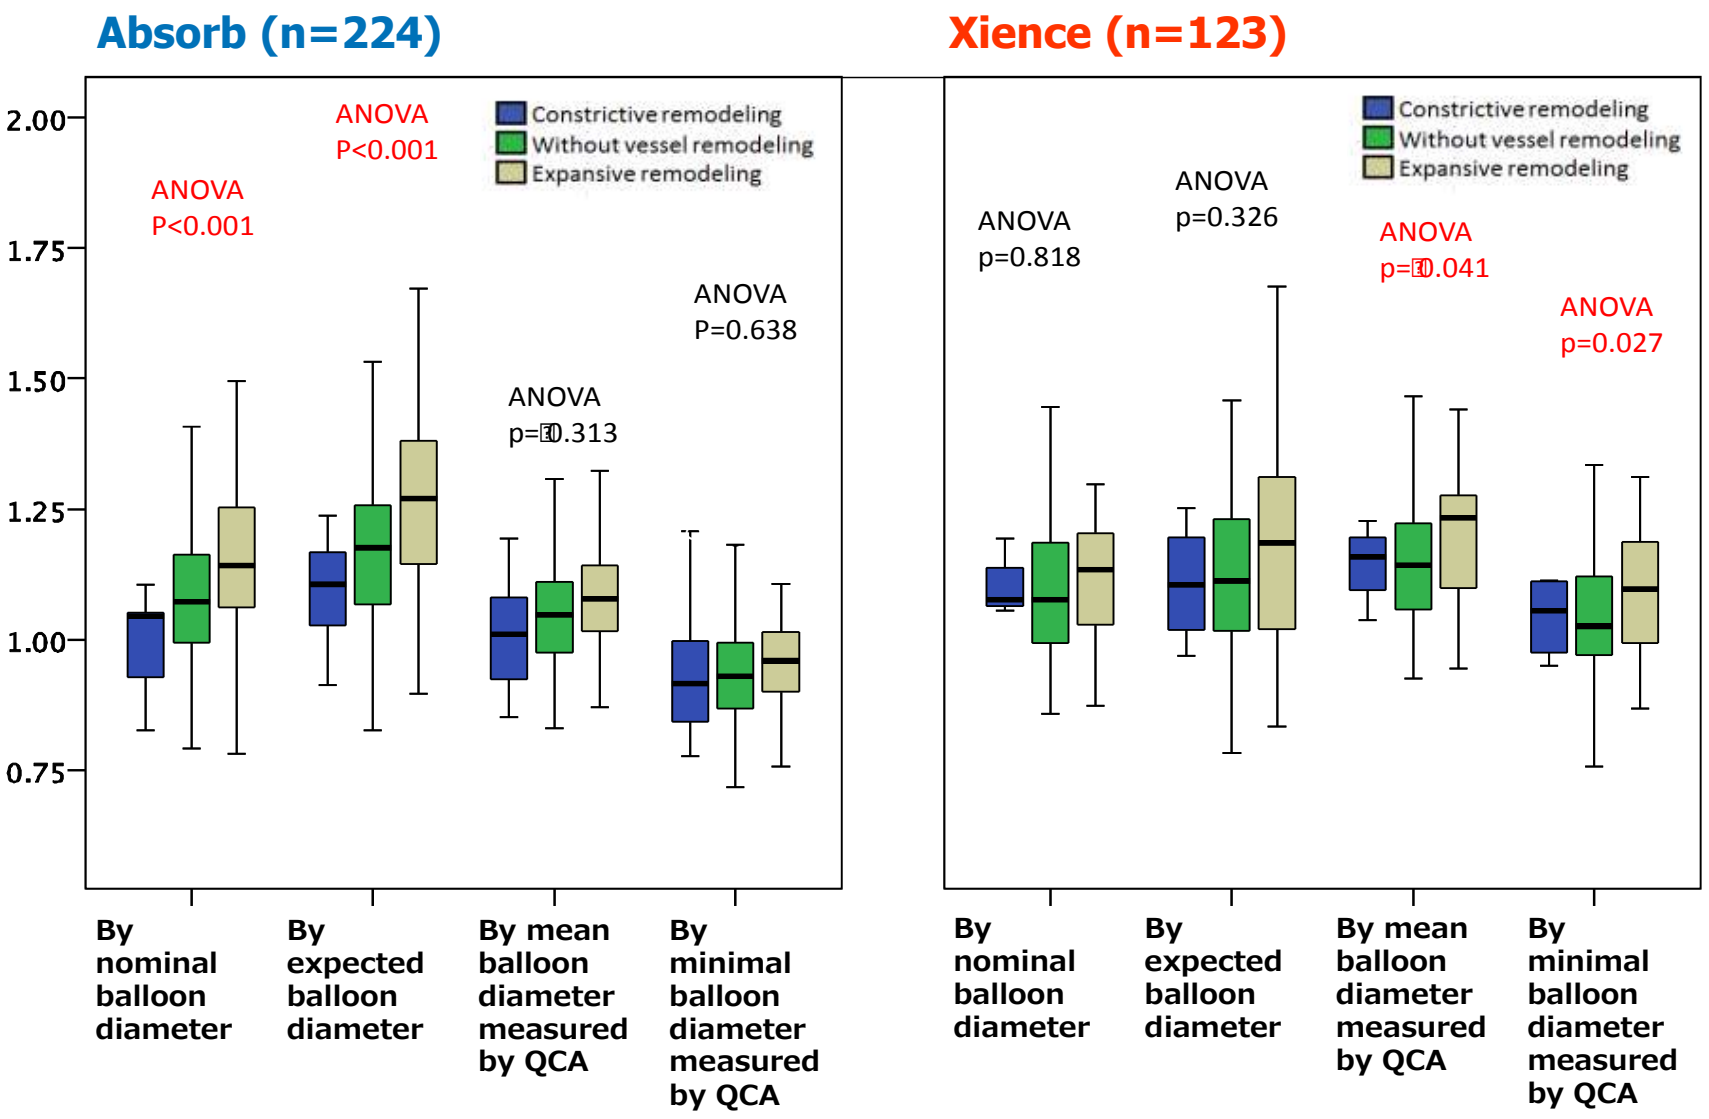
Pre-procedural IVUS-VH and Vessel Remodeling over 3 years in ABSORB II



Various balloon-artery ratios and vessel remodeling



Independent Predictors for expansive remodeling over 3 years *Multivariate analysis from ABSORB II*

	Absorb		
	OR	[95% CI]	p value
Female	3.25	[1.35-7.81]	0.008
Expected balloon-artery ratio > 1.25	3.17	[1.23-8.14]	0.017
Post-procedural IVUS: expansion index ≥ 0.8	3.91	[1.49-10.22]	0.005
mean LDL cholesterol over 3 years (per mmol/L)	2.67	[1.38-5.17]	0.004
Pre-procedural IVUS-VH: necrotic core > 16.7%	2.5	[1.08-5.79]	0.033
Previous PCI	2.09	[0.90-4.86]	0.088
Post-procedural IVUS: asymmetry index > 0.3	1.65	[0.60-4.52]	0.334
Post-procedural IVUS: eccentricity index < 0.7	0.95	[0.35-2.57]	0.922
Pre-procedural IVUS: mean lumen area (per mm^2)	0.91	[0.54-1.55]	0.73
Pre-procedural IVUS: mean vessel area (per mm^2)	1	[0.81-1.23]	0.966

Independent Predictors for expansive remodeling over 3 years *Multivariate analysis from ABSORB II*

- Absorb implantation, female gender, expected balloon-artery ratio ≥ 1.25, expansion index ≥ 0.8, previous PCI, and higher mean level of LDL cholesterol (average over 3 years) were independent factors predicting expansive remodeling.

- Especially in the Absorb arm, pre-procedural greater proportion of necrotic core (> 16.5% in mean plaque area) was also an independent predictor for expansive remodeling.

Why
The Technique of PSP
Is so Important ?

Procedural Characteristics of AMC PSP

Variable	QCA-based (N= 211 lesion)
Pre-dilation using NS balloon	199 (94.3%)
Post-dilation using NC balloon	109 (99.1%)
Post-dilation, Pressure (atm)	19.5 ± 5.3
Final balloon diameter (mm)	3.6 ± 0.3
Final scaffold diameter (mm)	3.5 ± 1.9
Balloon to artery Ratio of proximal RV	1.06 ± 0.14
Balloon to artery Ratio of distal RV	1.37 ± 0.40
Mean Balloon to artery Ratio	1.22 ± 0.30
Mean inflation time (sec)	25 + 12
Absolute difference of final scaffold diameter compare to QCA proximal RVD (mm)	0.2 ± 0.5
Absolute difference of final scaffold diameter compare to QCA distal RVD (mm)	0.8 ± 1.9

Why
The Technique of PSP
Is so Important ?

Large balloon to artery ratio and high pressure, long duration post-dilation can make a small absolute gain of final scaffold diameter.

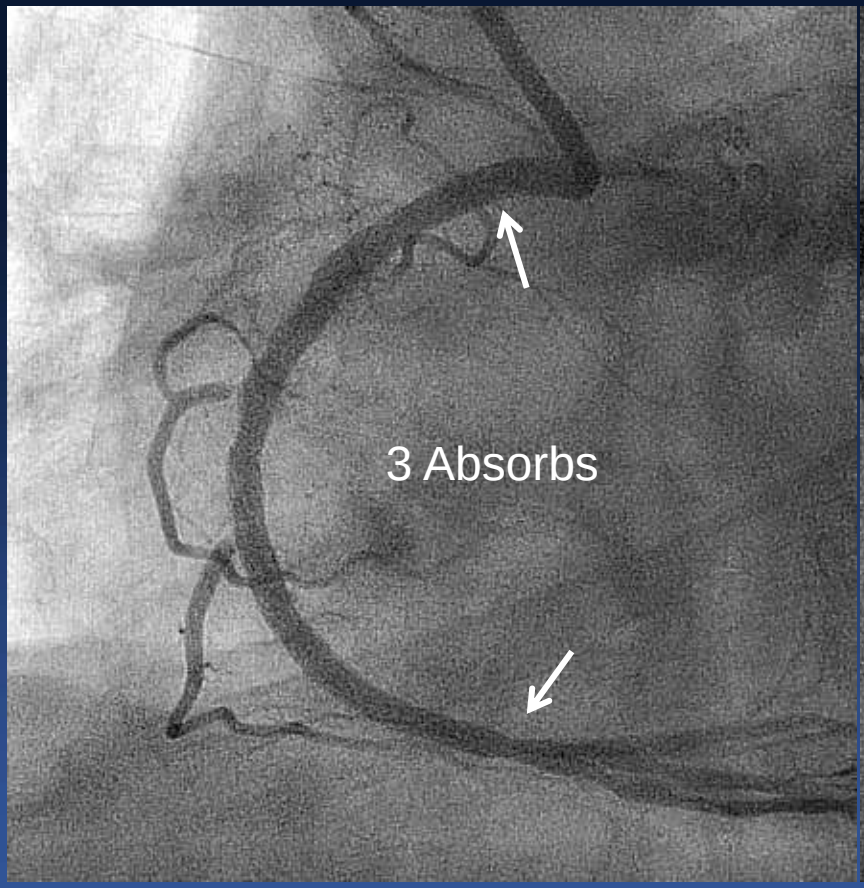
0 % Scaffold Thrombosis

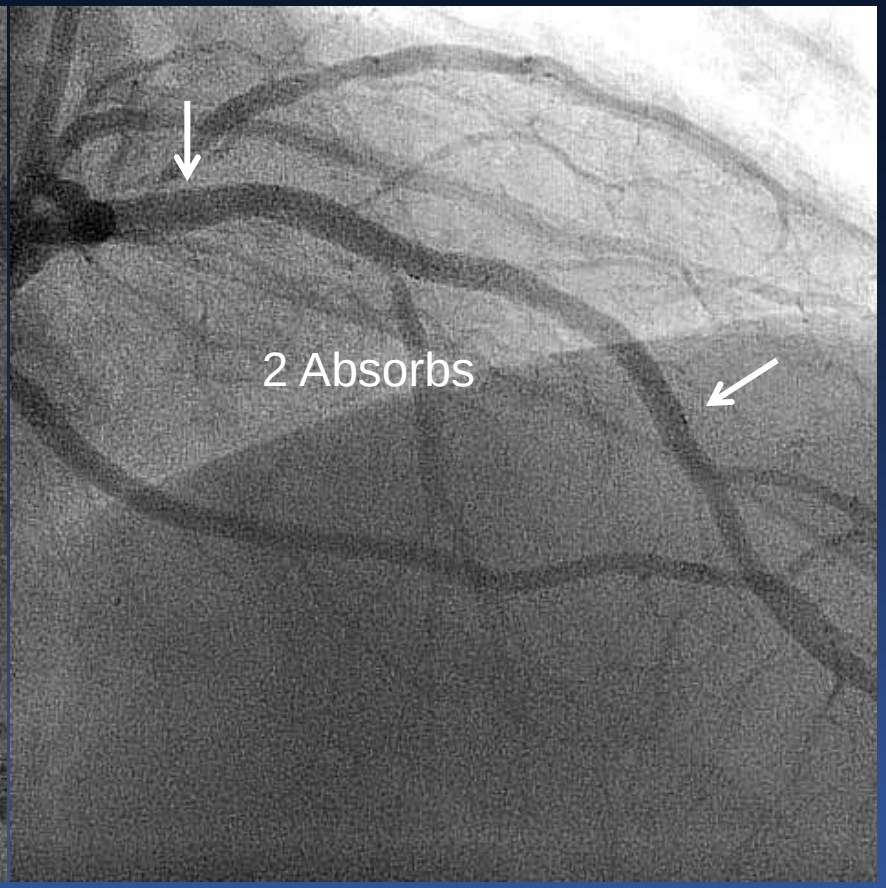
1. Big vessel >2.5 mm
2. BVS sizing by QCA - same size with proximal RVD
3. Balloon to artery ratio >1.2,
   (usually 0.5 mm bigger NC balloon)
4. Post-dilation with high pressure using NC balloon
   (mean 19 atm, 16~25), long duration >20 sec
5. Long lesion BVS implantation(>28 mm),
   imaging guided is mandatory
6. Triple antiplatelet therapy (DAPT+Cilostazol)
   for 6 months in selected cases.

68 y/o male, Stable angina, 2-Vessel Disease, Diffuse Long in RCA, Tandem Lesions in LAD

Polymer Jacket !

5 ABSORBs in A Patient



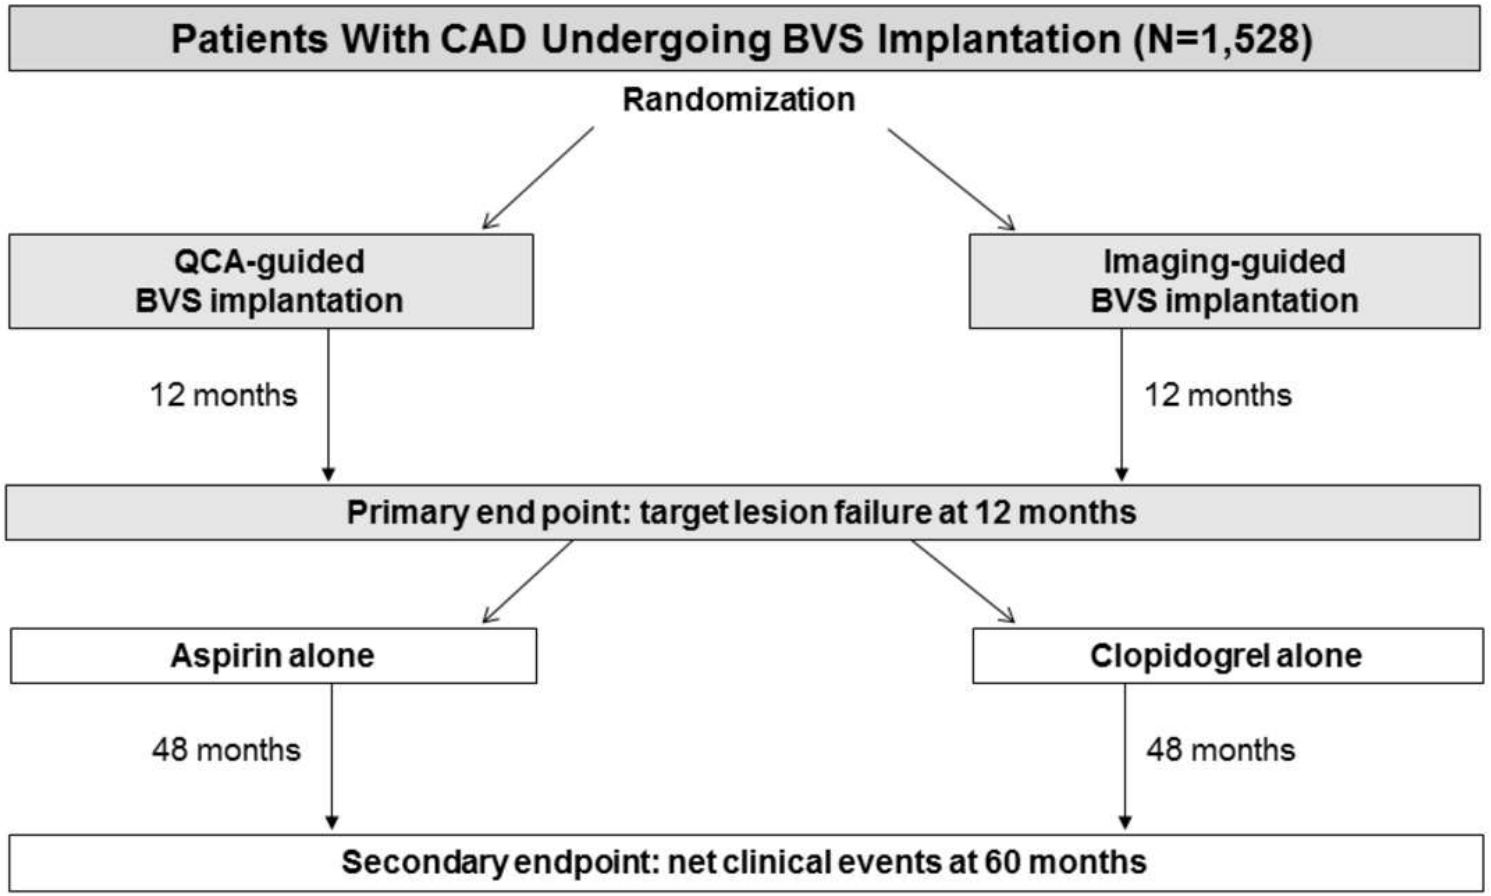


Unresolved Issues

1. Is Imaging guided BVS implantation mandatory ?
2. What are the results in complex long lesion compared to those of 2nd Generation DES ?
3. Is one year DAPT enough ?
4. Are the long term results really better with Absorb ?

QCA guided vs. Image guided

GUIDE-BVS

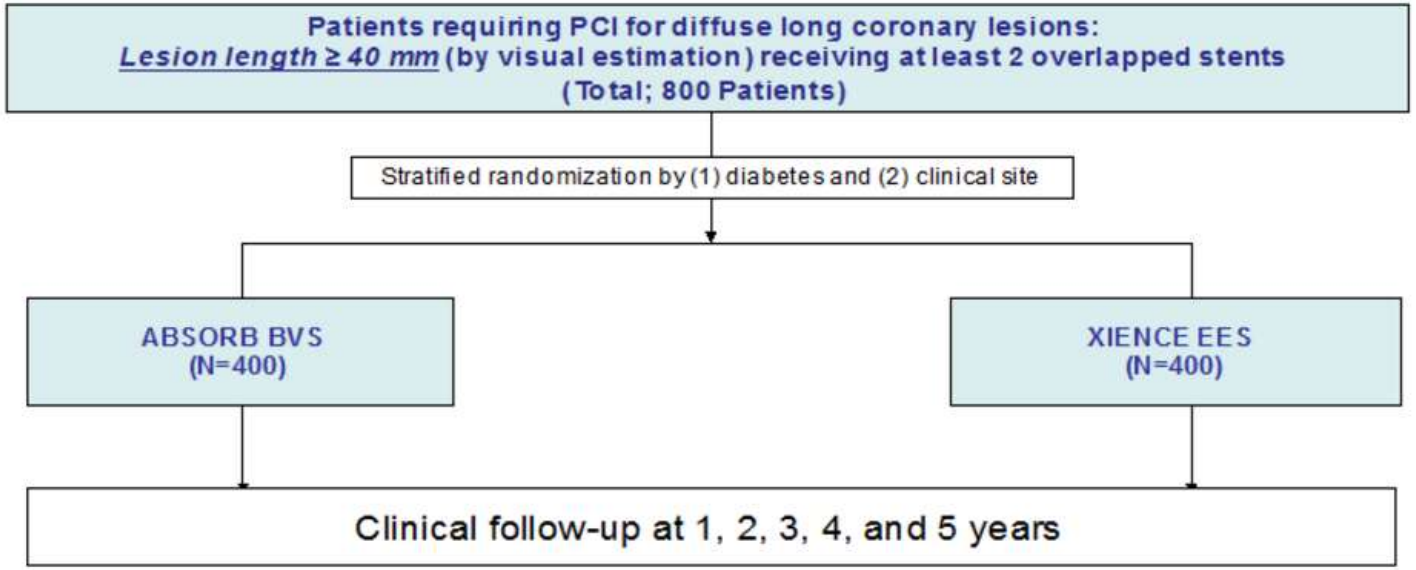


Target lesion failure: cardiac death, target vessel myocardial infarction, or ischemia-driven target lesion revascularization
Net clinical events: CVdeath, myocardial infarction, stroke, or clinically relevant bleeding

BVS for Long Lesion (>40mm)

Everolimus-Eluting Bioresorbable Scaffolds versus Everolimus-Eluting Metallic Stents for Diffuse Long Coronary Artery Disease

ABSORB-LONG Trial

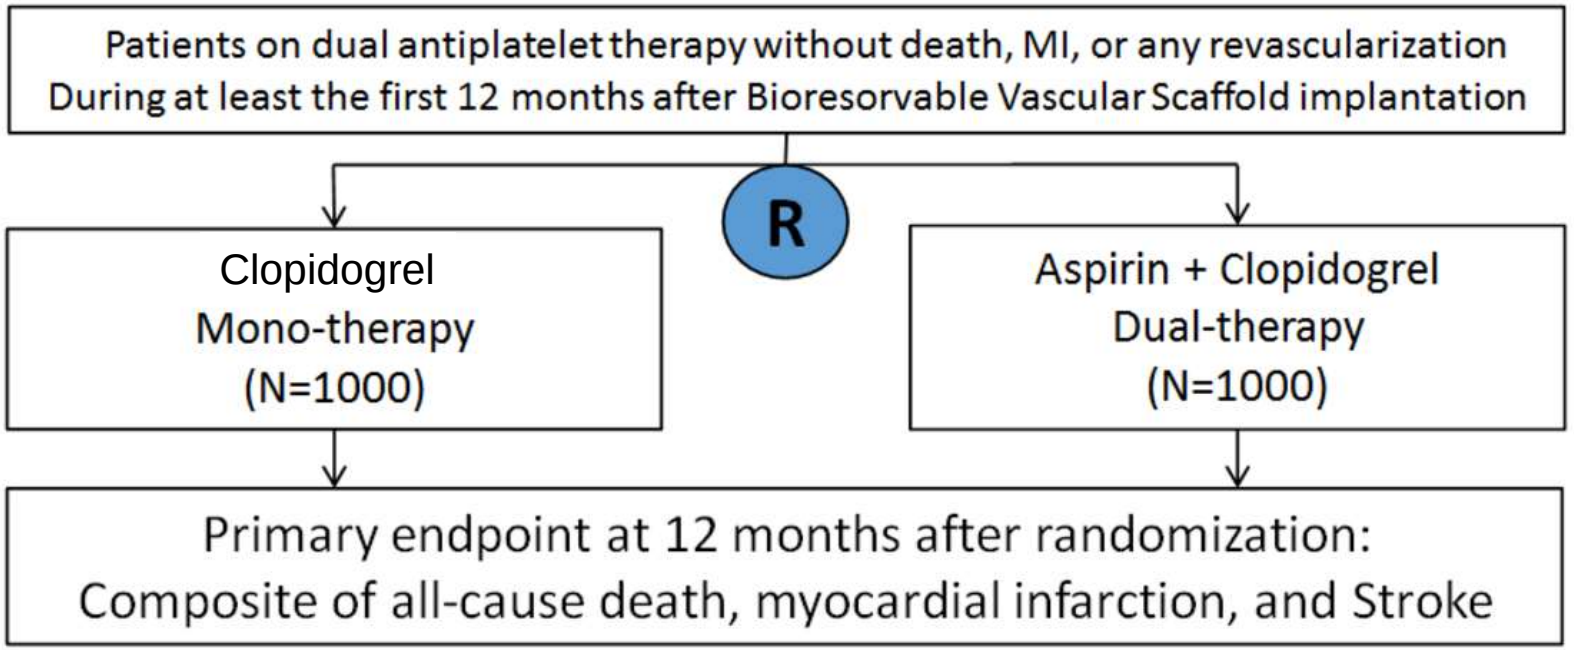


*Primary endpoint: target-lesion failure (composite of cardiac death, TV-MI, or ID-TLR) at 1 year

How Long DAPT ?

Optimal Duration of Antiplatelet Therapy after
Bioresorbable Vascular Scaffold Implantation
to Reduce Late Coronary Arterial Thrombotic Events

BVS-LATE trial



There are Concerns about BVS,
It's a Chance to Move Forward !

Thank You !!
