Safety and clinical performance of Orsiro DES in the treatment of subjects with single de novo coronary artery lesions

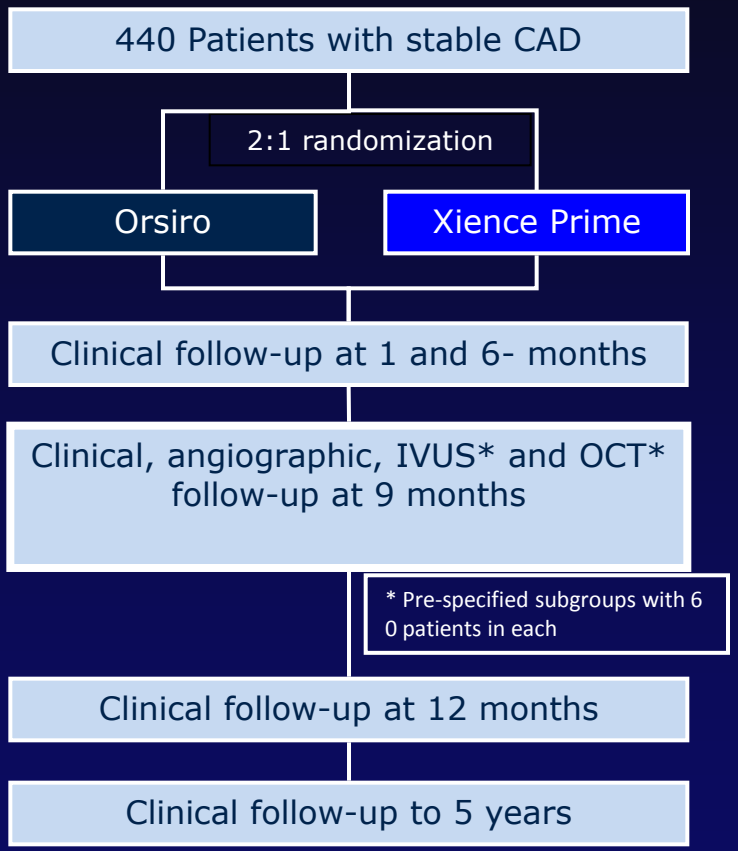
BIOFLOW-II

DESIGN
An international, prospective, multi-center, randomized, controlled trial comparing the Orsiro DES to Xience Prime

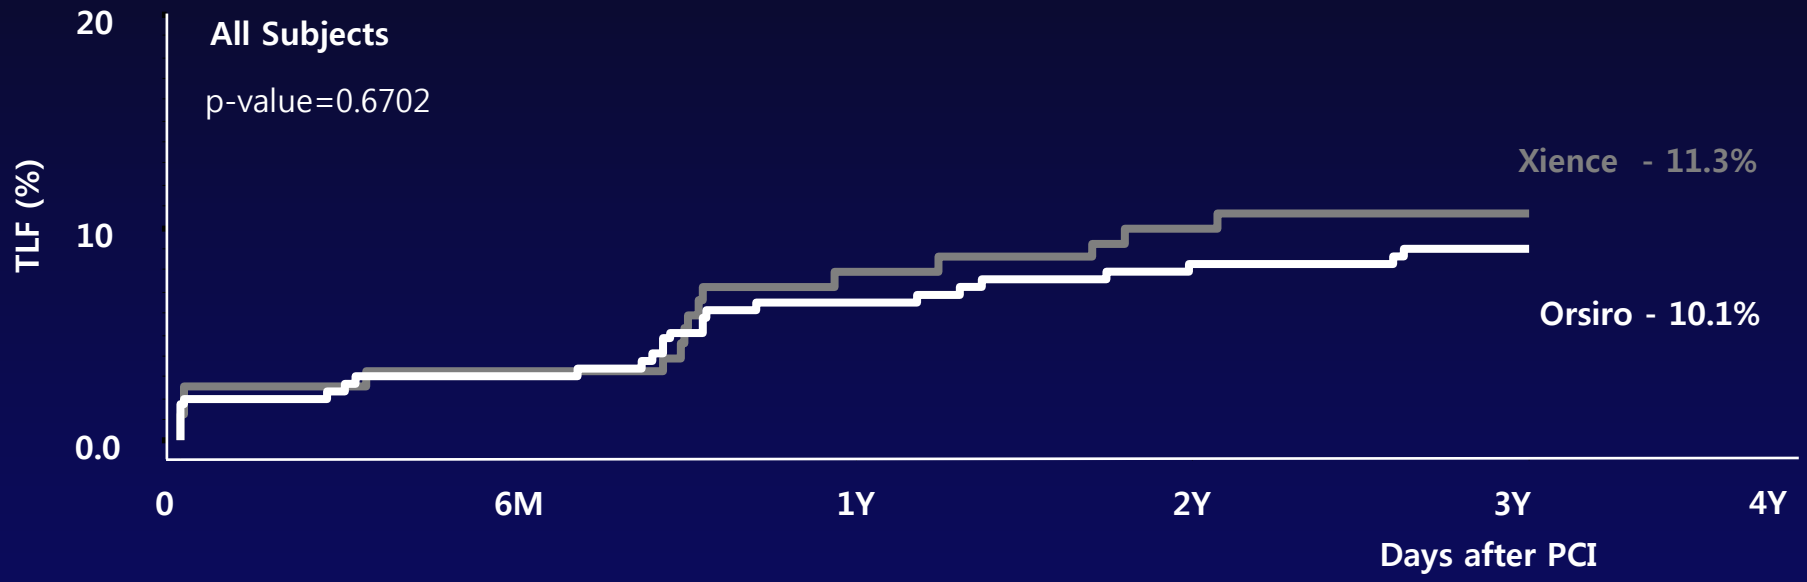
OBJECTIVE
To compare the Orsiro stent with a bioabsorbable polymer to the XIENCE Prime® stent with a durable polymer for the treatment of de novo coronary lesions with respect to non-inferiority for in-stent Late Lumen Loss (LLL) at 9-months

COORDINATING CLINICAL INVESTIGATORS
Prof. Stephan Windecker, Bern, Switzerland
Dr. Thierry Lefèvre, Massy, France

PRIMARY ENDPOINT
In-stent Late Lumen Loss at 9-month



TLF rate at 48 months

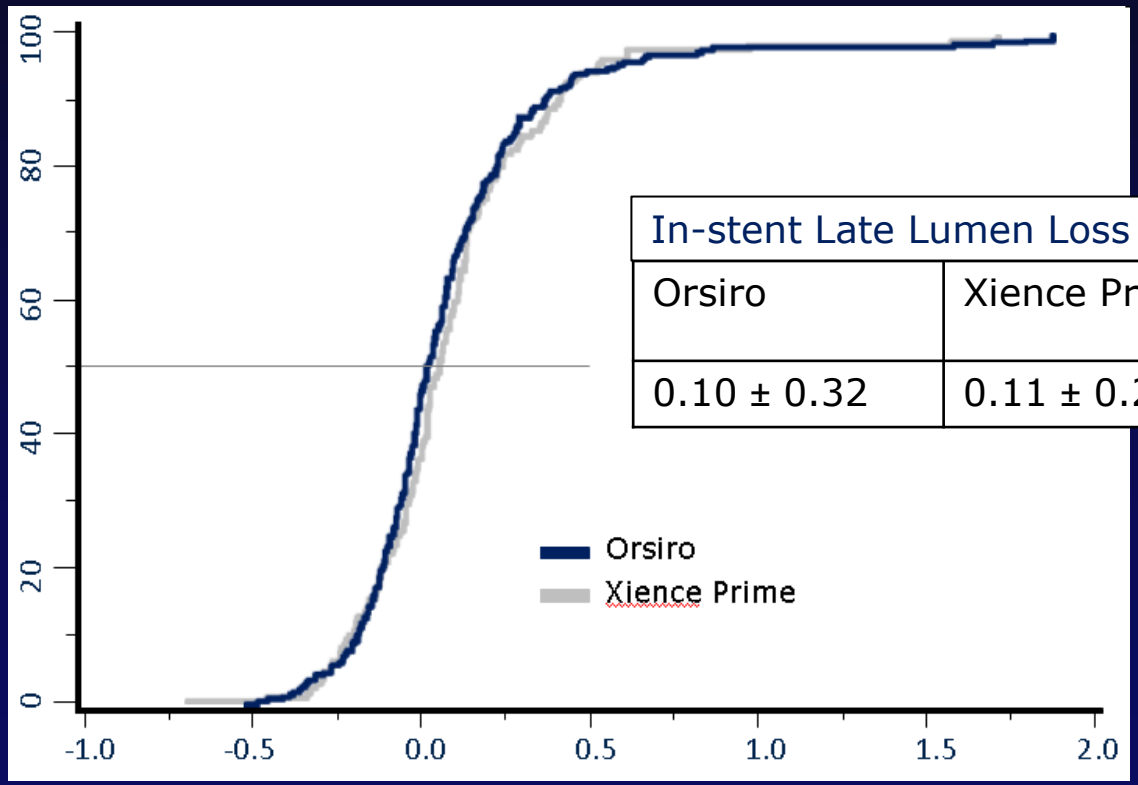


Source: T. Slagboom, oral presentation, TCT 2016

Primary angiographic endpoint
In-stent Late Lumen Loss

BIOFLOW-II

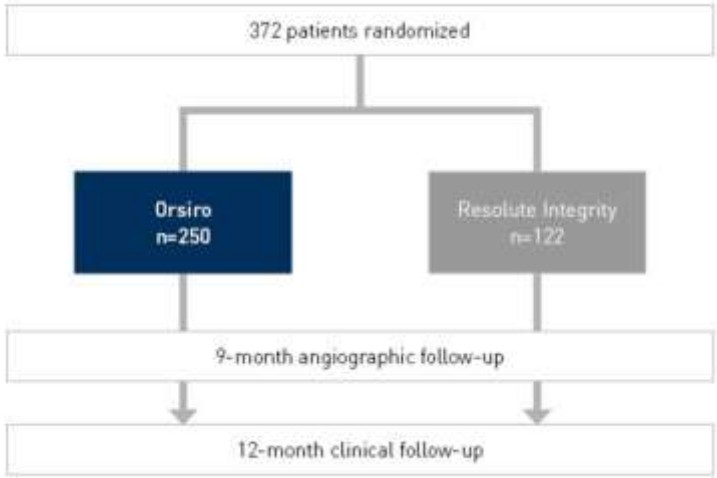
Cumulative frequency of in-stent Late Lumen Loss at 9 months (mm)



In-stent Late Lumen Loss at 9 months (mm)		
Orsiro	Xience Prime	p-value for non-inferiority
0.10 ± 0.32	0.11 ± 0.29	< 0.0001

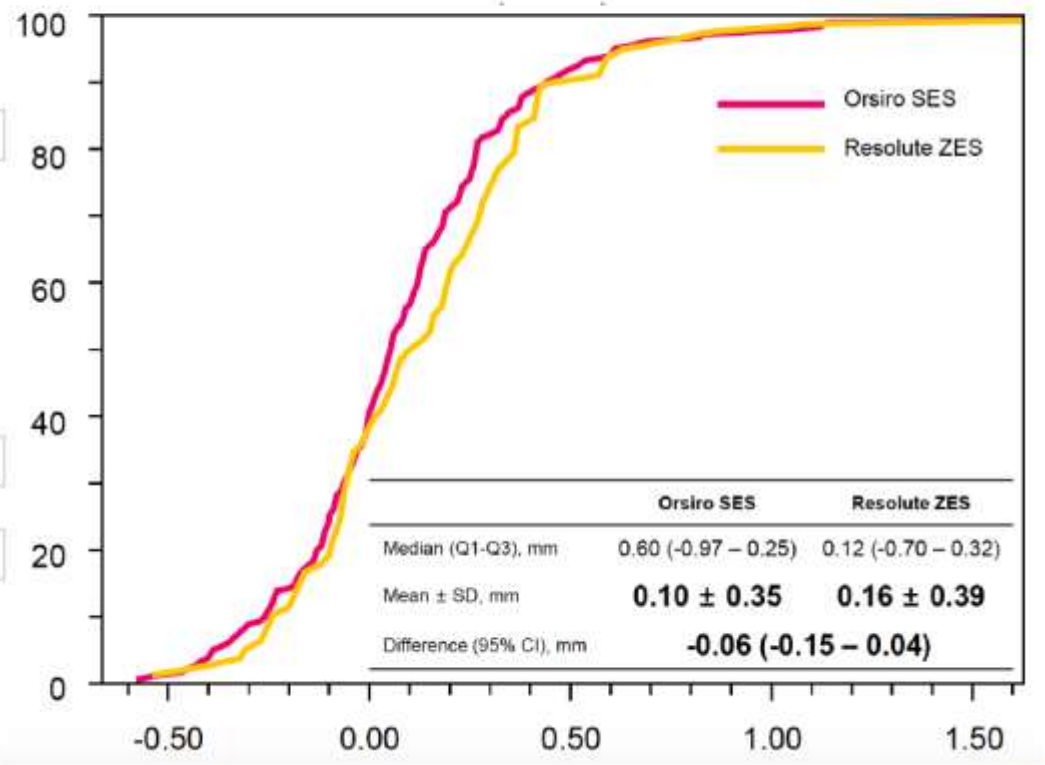
Sources: Windecker S. et al., Comparison of a Novel Biodegradable Polymer Sirolimus-Eluting Stent With a Durable Polymer verolimus-Eluting Stent Results of the Randomized BIOFLOW-II Trial, Circ Cardiovasc Interv, DOI: 10.1161/CIRCINTERVENTIONS.114.001441

Reproducible In-stent Late Lumen Loss



ORIENT: Late Lumen Loss at 9 Months

RCT, 2:1 BP-SES (Orsiro) versus DP-ZES (Resolute Integrity), n=372



Kang SH, Eurointervention, 2017

The most powerful Orsiro trial yet provides data against the strongest competitors

DESIGN
Large-scale, investigator-initiated, assessor and pati ent-blinded, multicenter, three-arm, randomized co ntrolled trial. 3,514 all-comers patients randomly as signed (1:1:1) to treatment with Orsiro, Synergy or Resolute Integrity

PRINCIPAL INVESTIGATORS
Prof. Clemens von Birgelen,
Thoraxcentrum Twente, Netherlands

PRIMARY ENDPOINT
Target vessel failure (TVF) at 12 months defined as the composite of cardiac death, target vessel-relate d myocardial infarction (MI), or target vessel revasc ularization (TVR)

BIO-RESORT

- All-comer patients: any patient who requires a percutaneous coronary intervention with DES implantation
- Patients with any clinical syndrome, number of target lesions or vessels, any lesion length, vessel size, etc.

- **Inclusion criteria:** Pat. ≥ 18 yrs.; PCI with DES required; informed consent; ability and willingness to comply with study procedures and follow-up
- **Exclusion criteria:** Participation in another drug or device RCT before reaching primary EP; life expectancy < 1 year; planned surgery < 6 mo's unless DAPT maintained; known pregnancy; known intolerance to DES, anticoagulants or antiplatelet drugs preventing DAPT

3,514 all-comers were 1:1:1 randomized to DES type and assessed

Everolimus-eluting	Zotarolimus-eluting	Sirolimus-eluting
SYNERGY	RESOLUTE INTEGRITY	ORSIRO

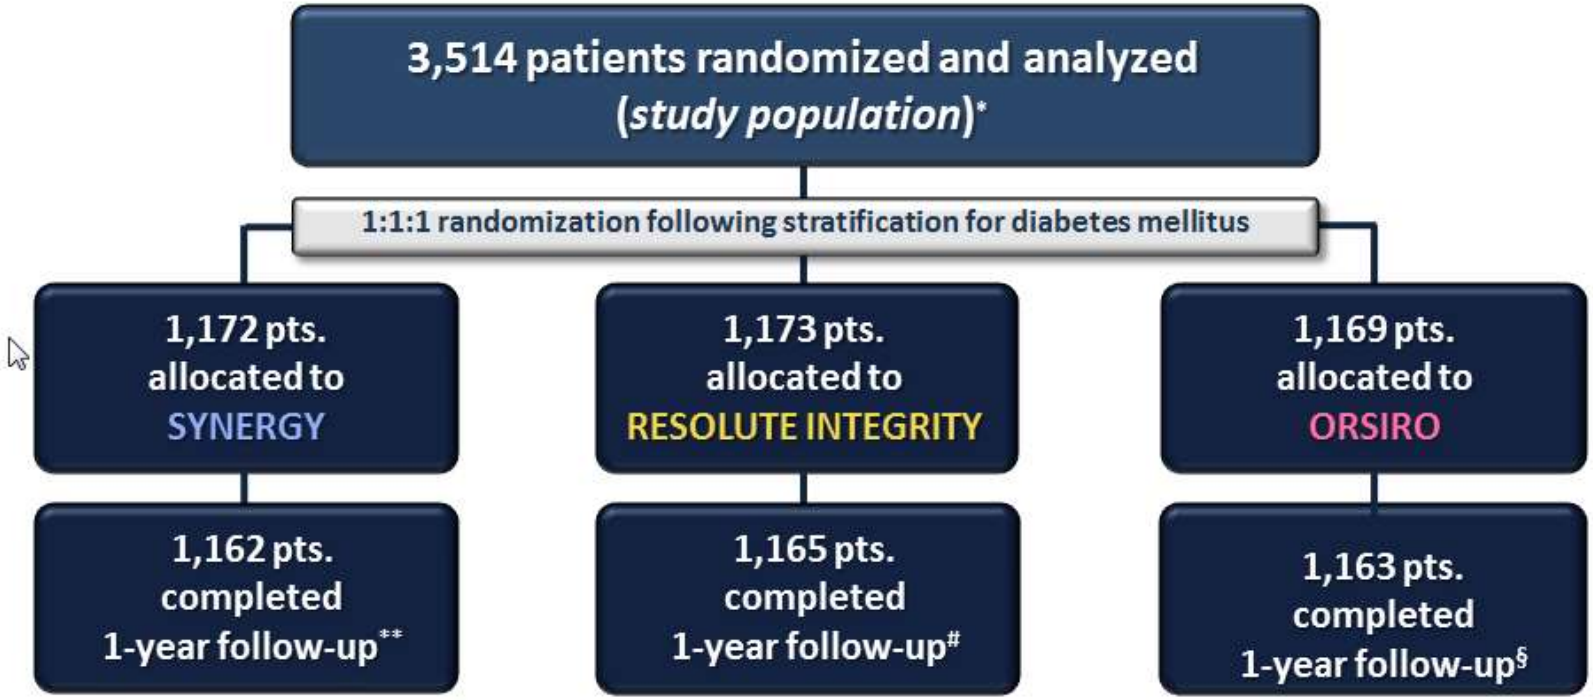
30 days | **1 year** | 2 years | 3 years | 4 years | 5 years

Investigator-initiated, multicenter, assessor and patient-blinded, three-arm, randomized, non-inferiority trial · Visits to outpatient clinic, questionnaire or telephone follow-up · No routine angiographic follow-up · Independent monitoring and clinical event adjudication (CEC) · Supervision by DSMB

- **Primary endpoint** Target Vessel Failure at 1-year (composite of cardiac death, target vessel-related myocardial infarction, or clinically driven target vessel revascularization) to test 2 independent hypotheses that the safety and efficacy of both ORSIRO and SYNERGY is non-inferior to the reference device RESOLUTE INTEGRITY
- **Secondary endpoints** Death · myocardial infarction (MI) · repeat revascularization · stent thrombosis · TLF, MACE, POCE

BIO-RESORT Study Sites: Thoraxcentrum Twente, Medisch Spectrum Twente, Enschede · Rijnstate Hospital, Arnhem · Haga Hospital, The Hague · Albert Schweitzer Hospital, Dordrecht; all in the Netherlands · Enrollment from December 21, 2012 to August 24, 2015 · PI: C. von Birgelen, MD PhD – Thoraxcentrum Twente, MST, Enschede, the Netherlands

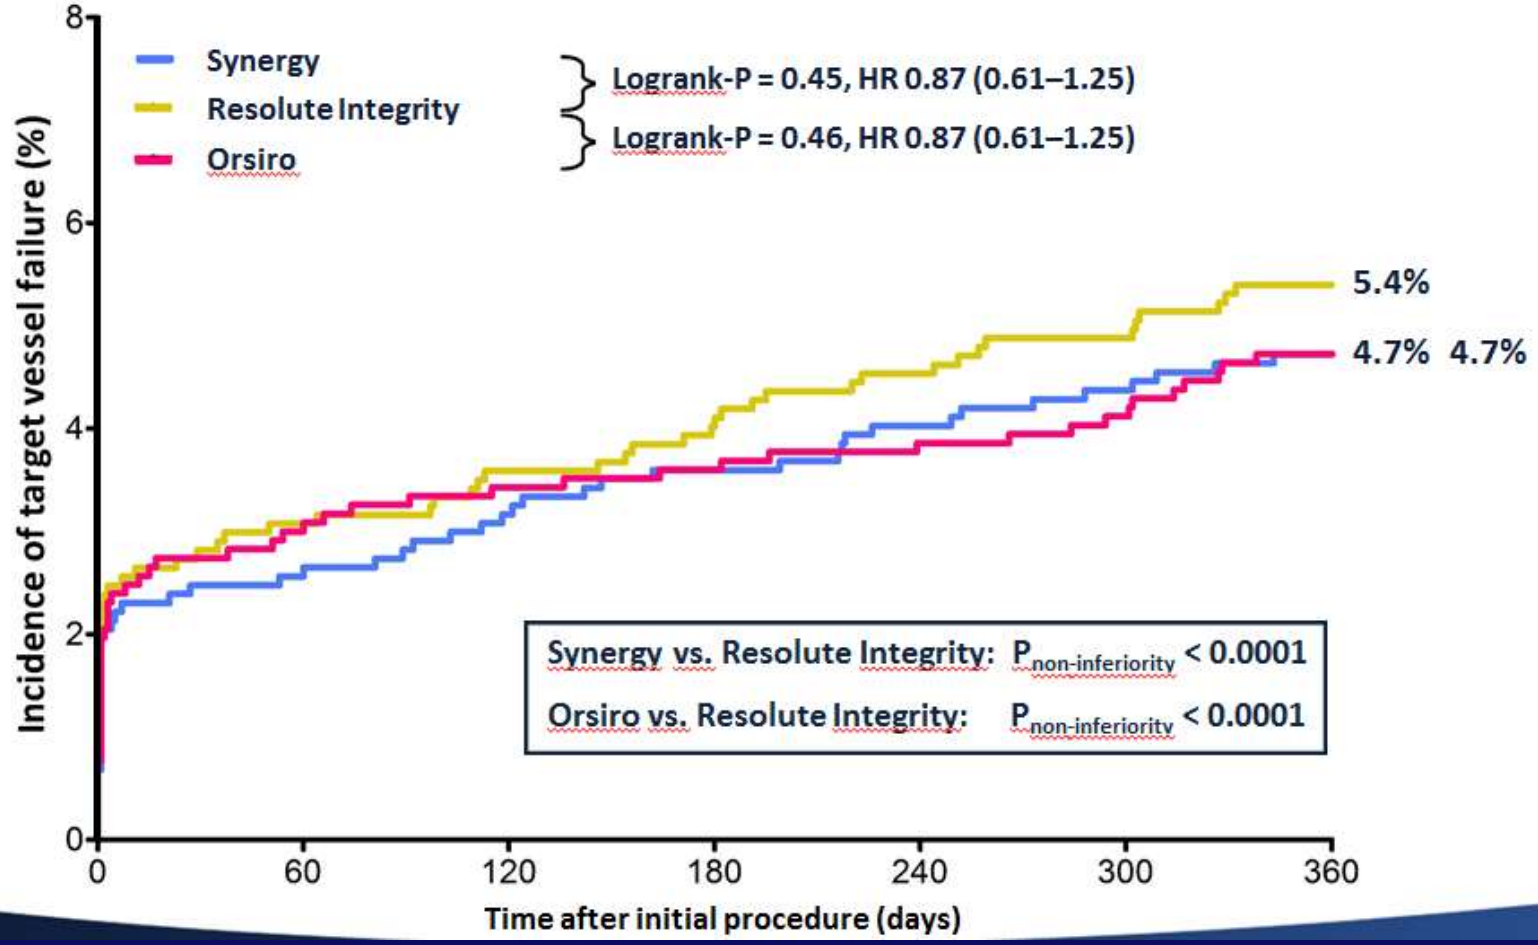
Study Flow Diagram



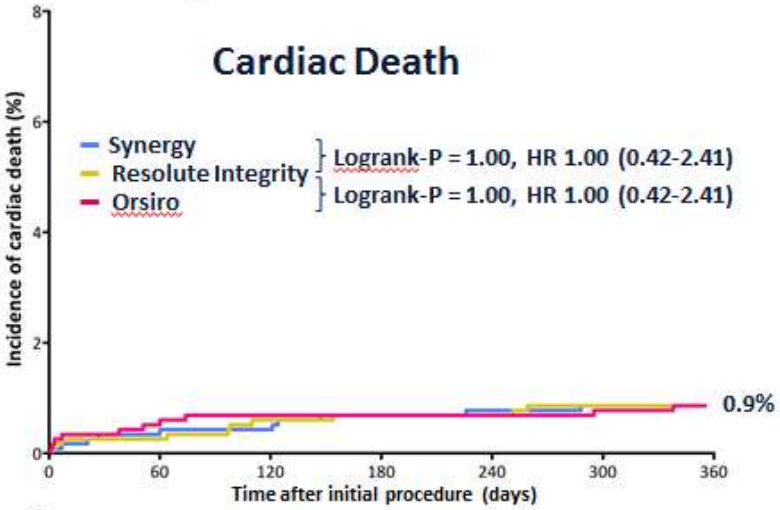
- 1-year follow-up data were obtained from 99.3% of the study population, which represents 99.9% of the patients who still participated in the trial or had died.
- During the first year of follow-up, 21 patients (0.6%) withdrew consent, while only 3 / 3,514 patients (< 1 ‰) were actually "lost" (i.e., could not be contacted).

Primary Endpoint

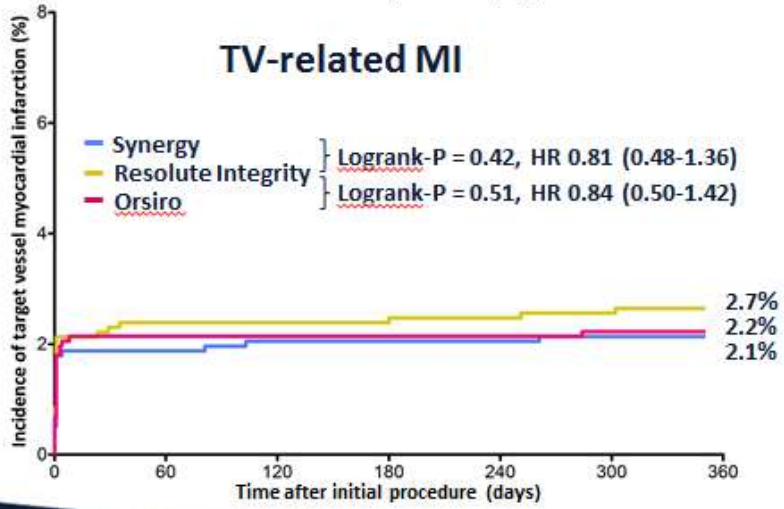
Target Vessel Failure at 1-Year Follow-Up

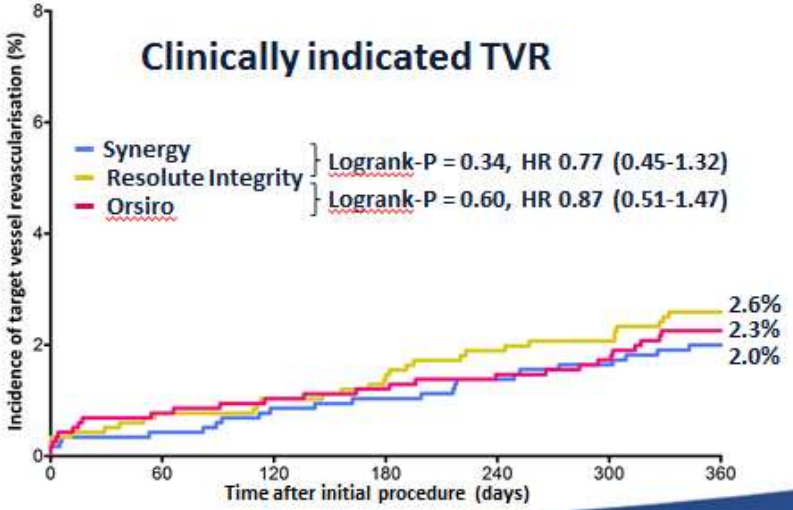


Components of TVF at 1-Year Follow-Up



At 1-year follow-up, there was no statistically significant difference between stent groups in the components of Target Vessel Failure (TVF).





Composite Clinical Endpoints

Clemens von Birgelen, Lancet, 2016

Conclusion

- Use of all three drug-eluting stents for the treatment of a complex all-comers population resulted in favorable clinical outcomes.
- Very thin strut everolimus-eluting Synergy and sirolimus-eluting Orsiro stents, which have dissimilar biodegradable polymer coatings, were non-inferior to the thin strut durable polymer zotarolimus-eluting Resolute Integrity stent.
- The absence of a loss of 1-year safety and efficacy with the use of the novel stents is a prerequisite before assessing potential benefits at longer term follow-up.

Registry for an all-comers patient population with the sirolimus eluting Orsiro stent system in daily clinical practice

BIOFLOW-III

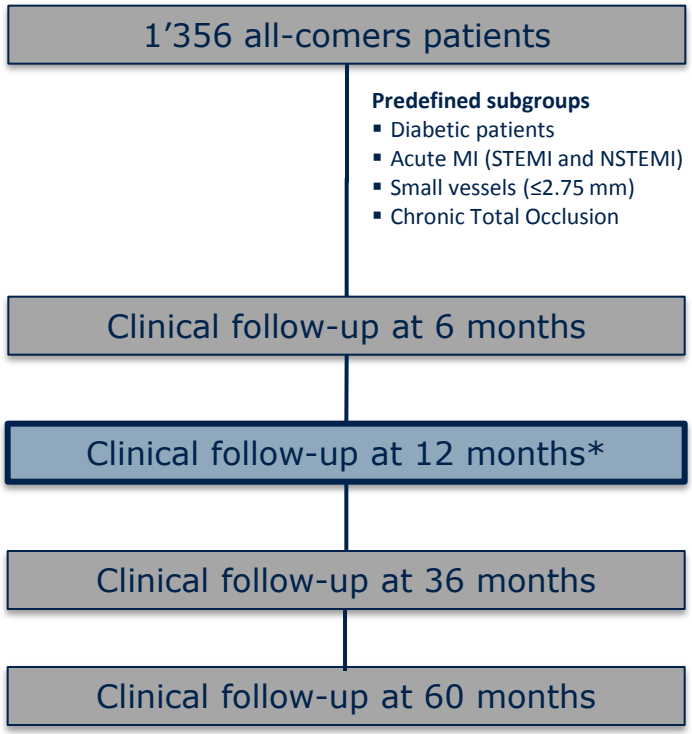
NCT01553526

DESIGN
An international, prospective, multi-center open-label, registry of the Orsiro hybrid DES in daily clinical practice

OBJECTIVE
Evaluate safety and clinical performance of the Orsiro drug eluting stent with a bioabsorbable polymer in a large patient population in standard clinical care

COORDINATING INVESTIGATOR
Prof. Dr. Johannes Waltenberger,
Universitätsklinikum Münster, Germany

PRIMARY ENDPOINT
Target Lesion Failure (TLF) at 12 months



* 97.4 % FUP compliance

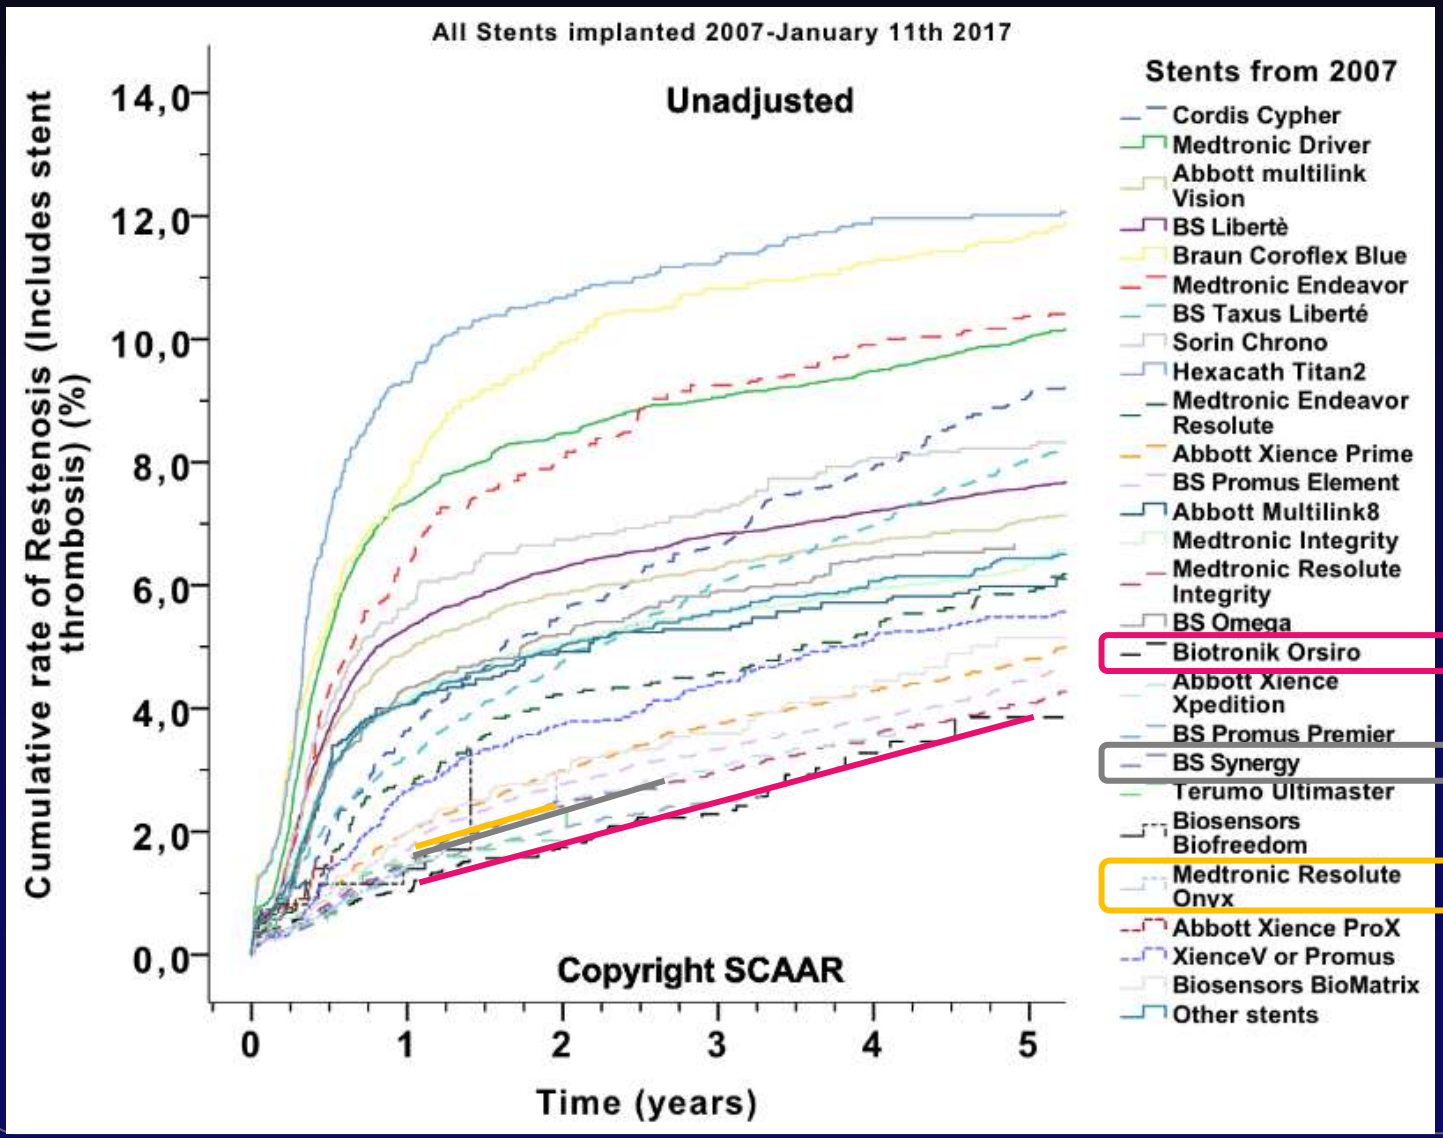
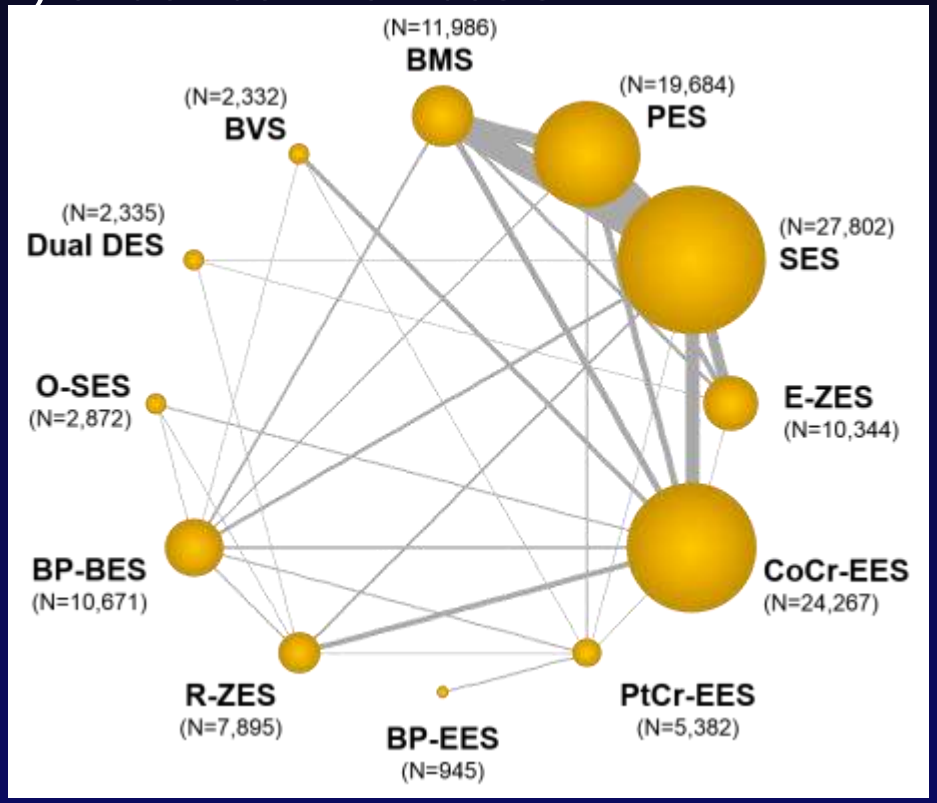
Real world data (SCAAR) even suggest that Orsiro is the best stent there ever was



Study Aim

- To compare the safety of contemporary DES including BVS in terms of the risk of stent thrombosis (ST) or device thrombosis.

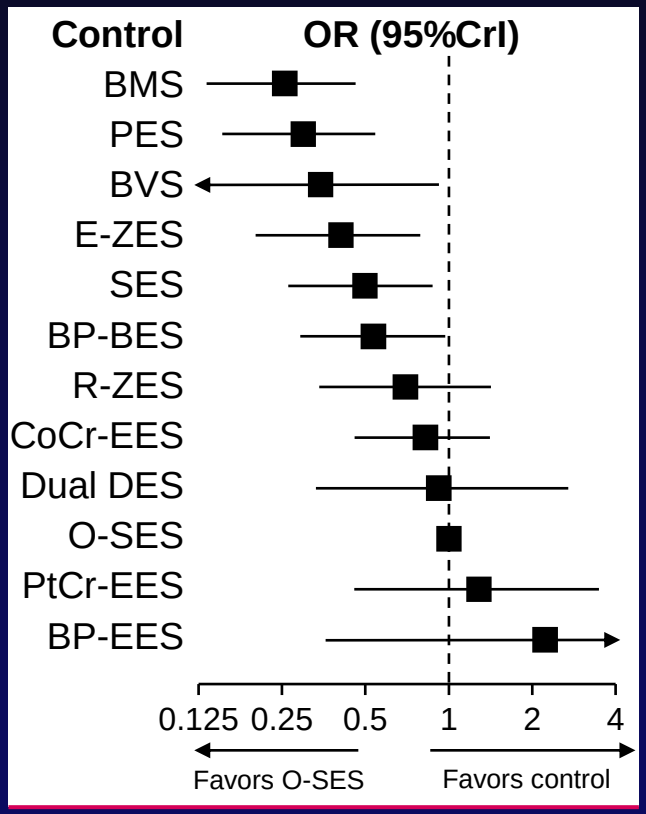
- Due to the low incidence rates of ST, a very large sample size is required to detect the differences in a single trial setting.
- A network meta-analysis has the advantage of providing comprehensive information by combining data from a complex network of multiple trials.



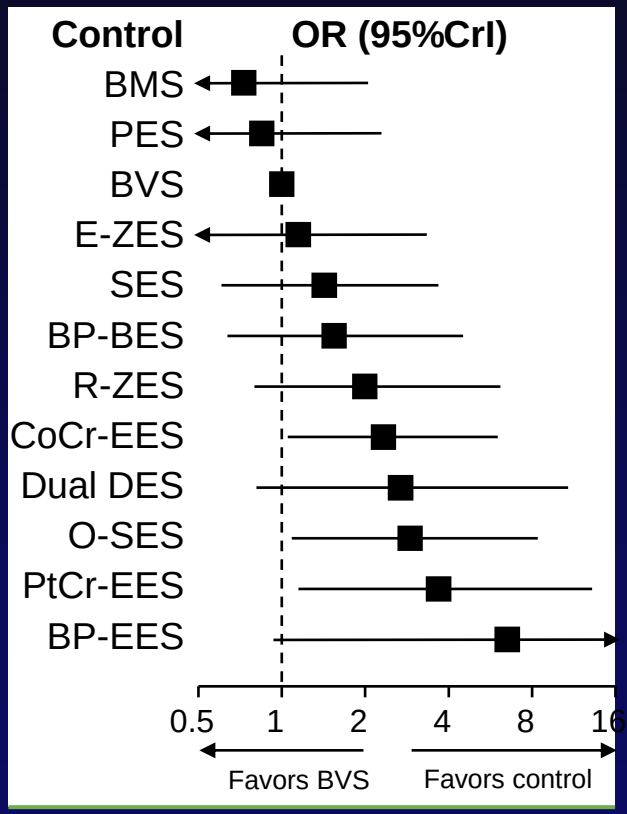
- We performed a systematic literature review of randomized controlled trials and updated a multiple-treatment network meta-analysis using a Bayesian framework.

Stent Thrombosis (definite or probable)

(C) O-SES *vs.* comparators



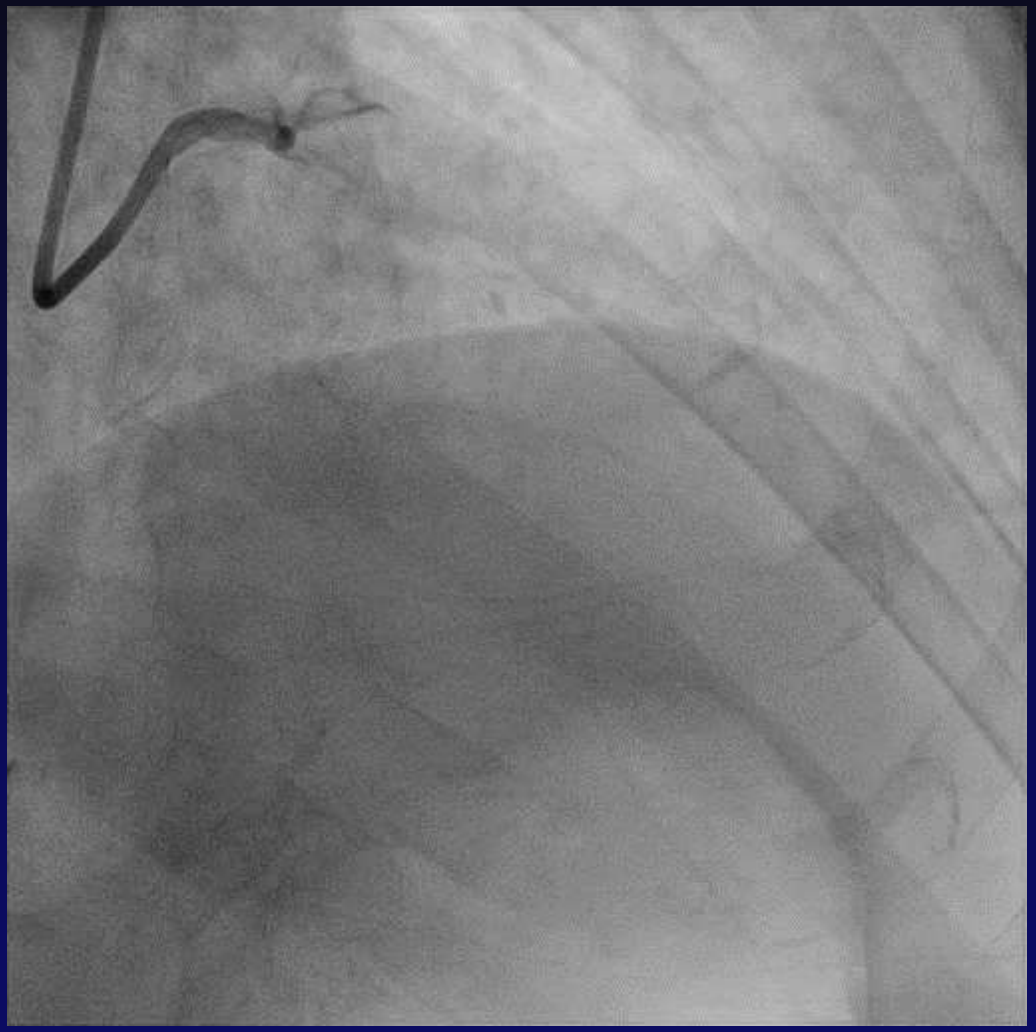
(D) BVS *vs.* comparators



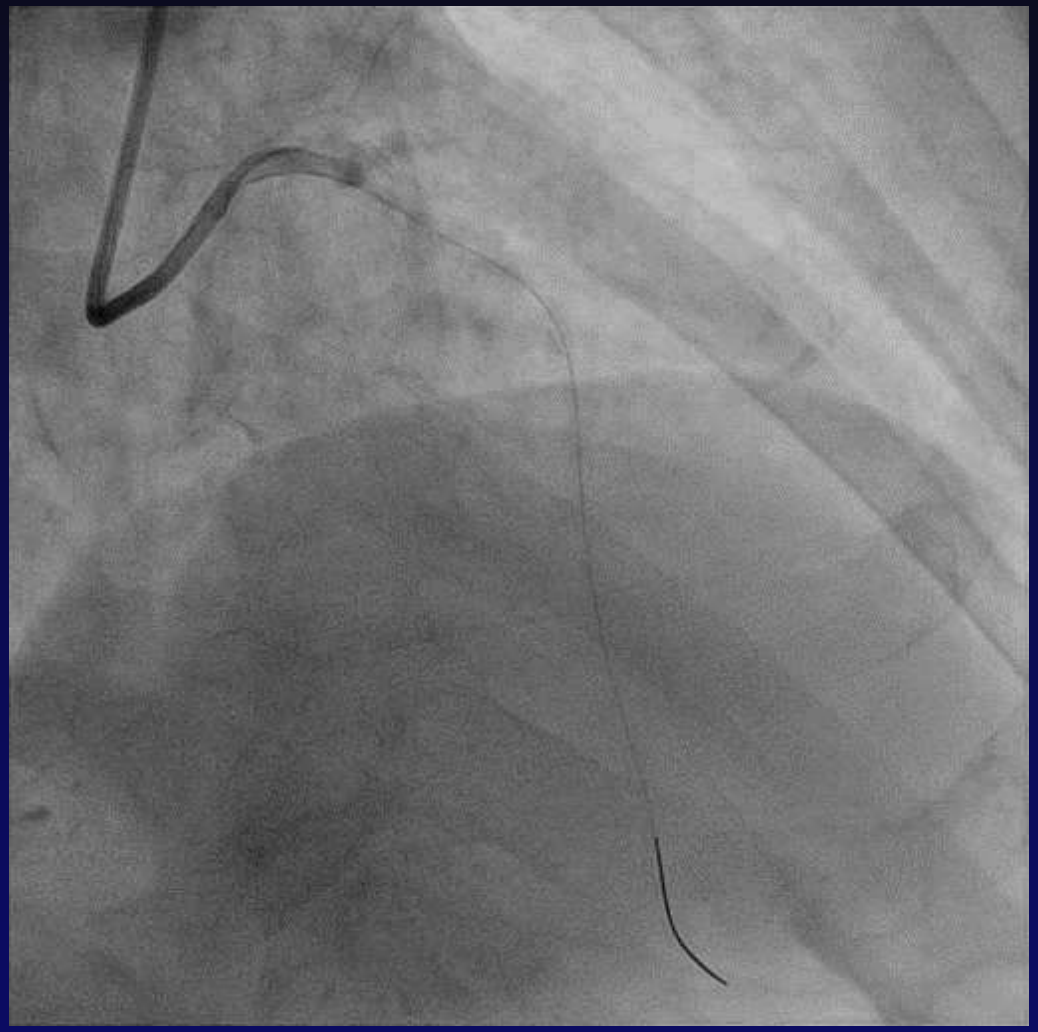
(BP-EES ≒ PtCr-EES ≒ O-SES ≒ Dual DES ≒ CoCr-EES)
> (ZES-R ≥ BP-BES ≥ SES) > (E-ZES) > (BVS ≥ PES ≥ BMS)

Kang SH, JACC Cardiovasc Interv. 2016

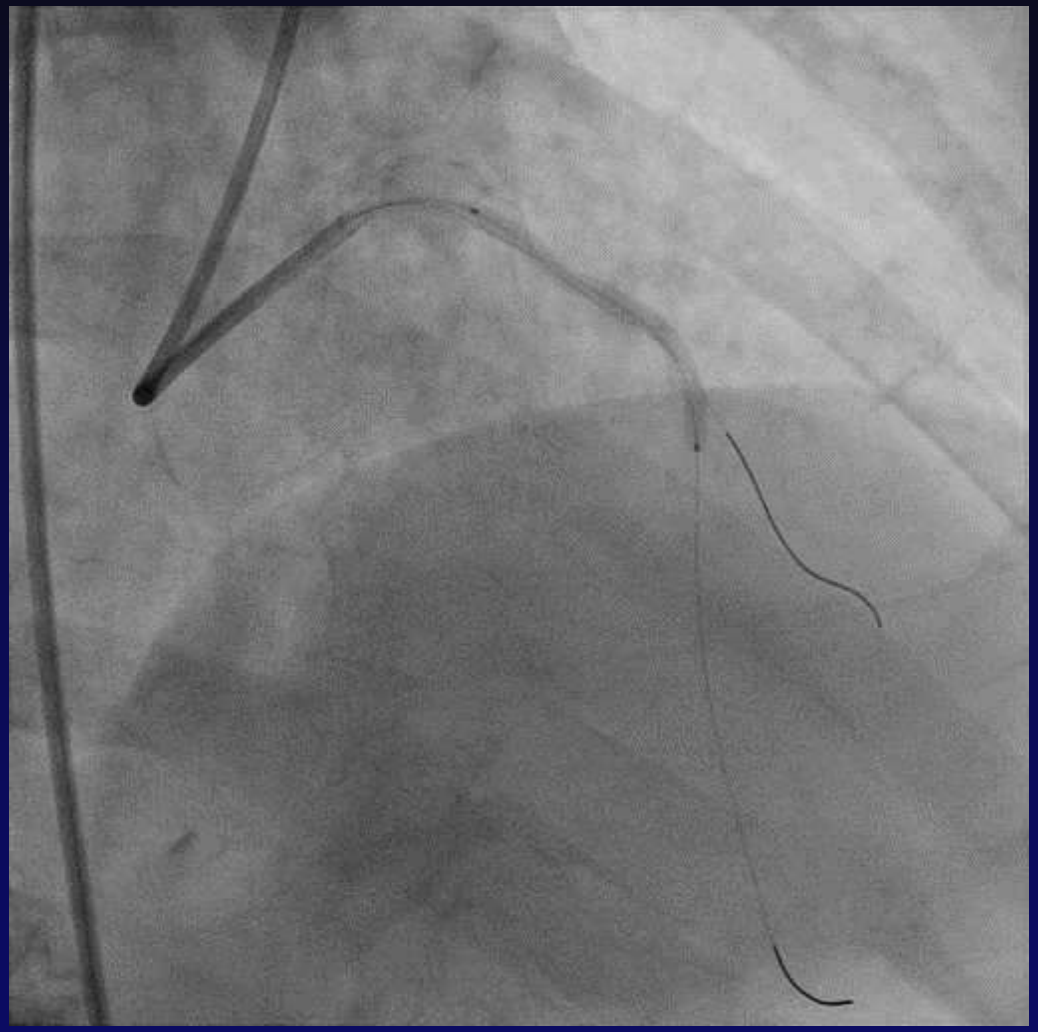
Case 1 – STEMI



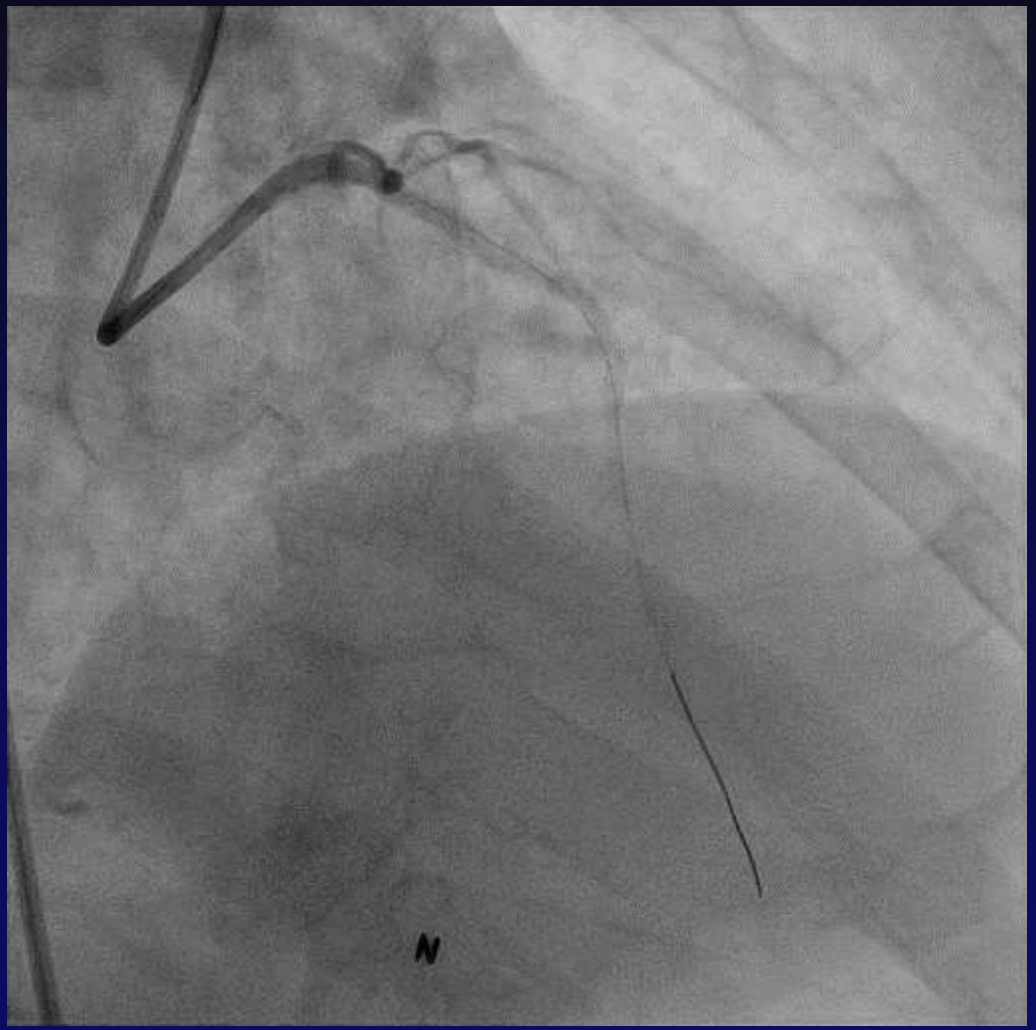
Case 1 – diffuse long lesion



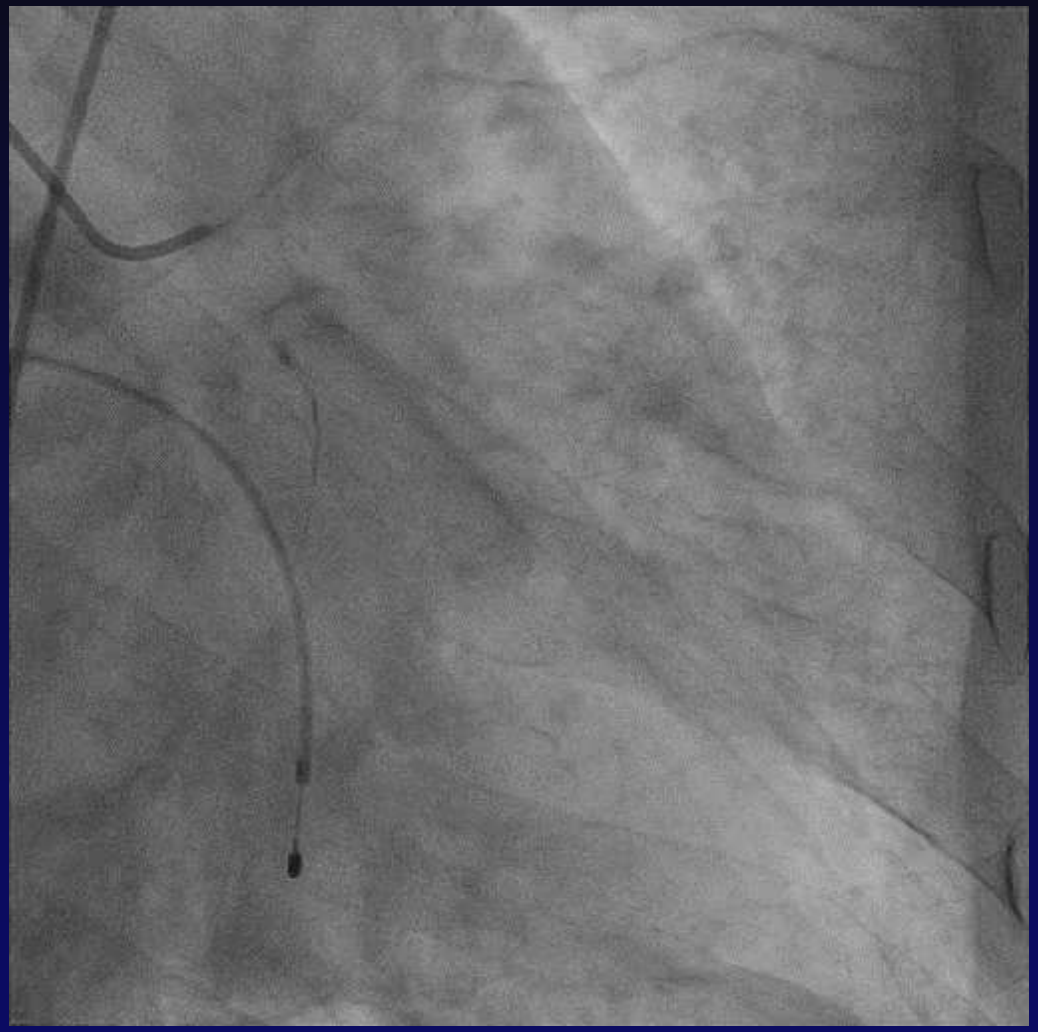
Case 1 – Stenting with Orsiro 2.75x40mm



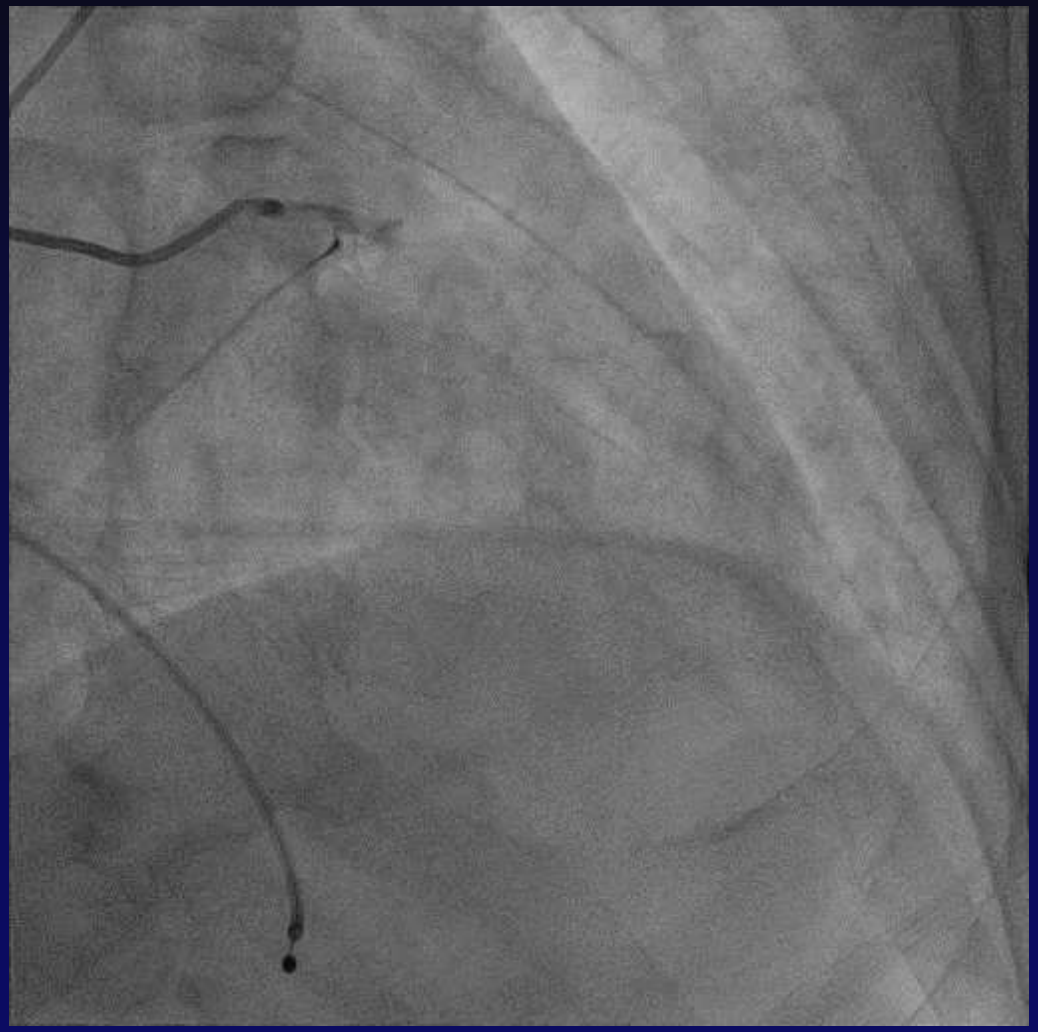
Case 1 – Good acute gain and flow



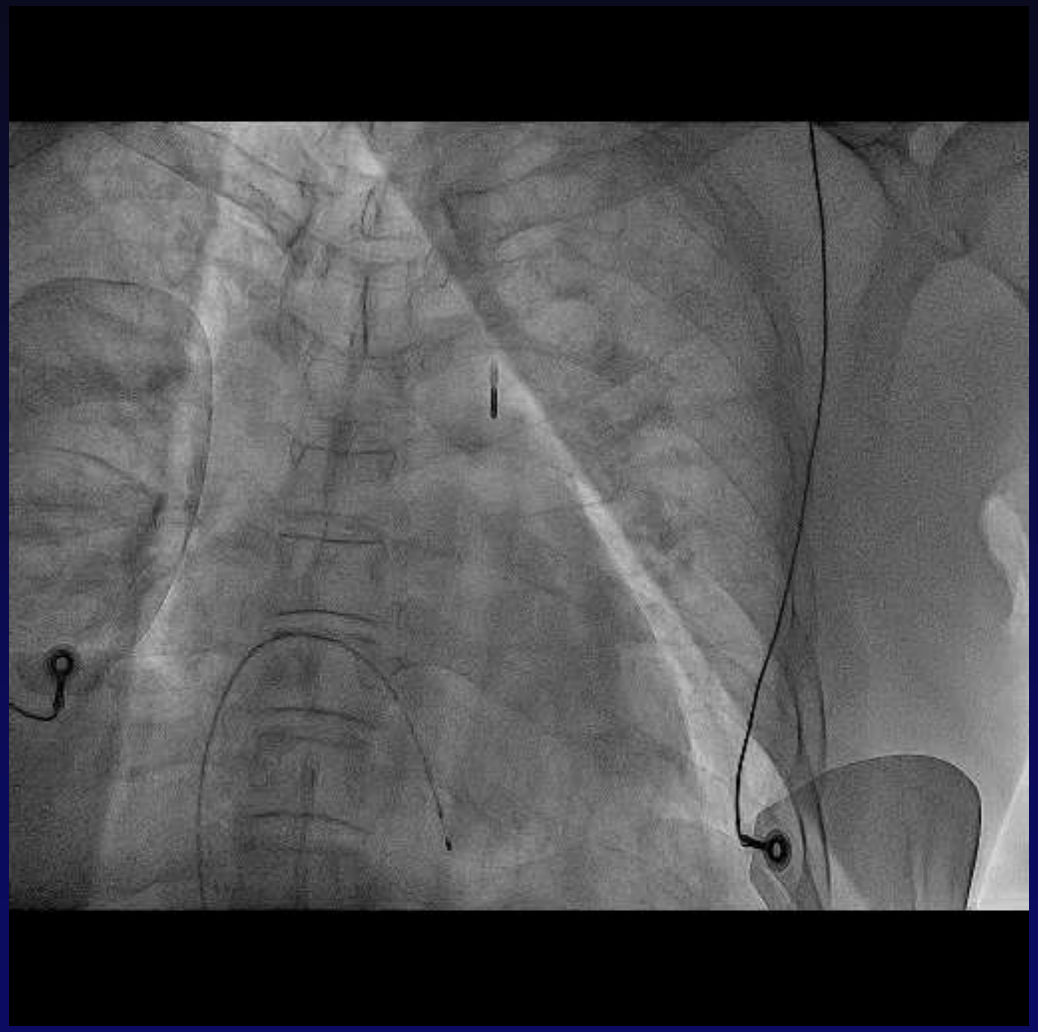
Case 2 – Cardiogenic shock, multivessel disease



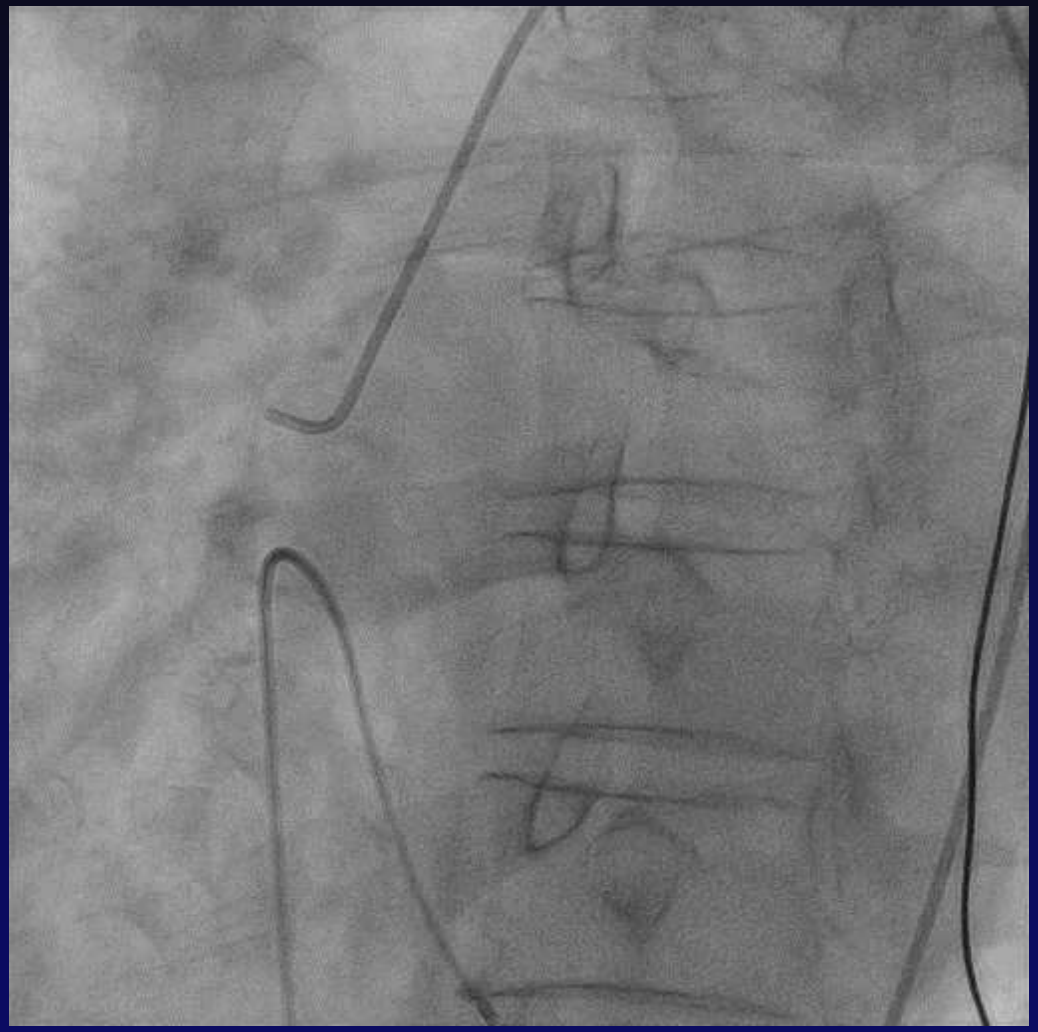
Case 2 – occlusion of dominant LCX and critical stenosis in LAD



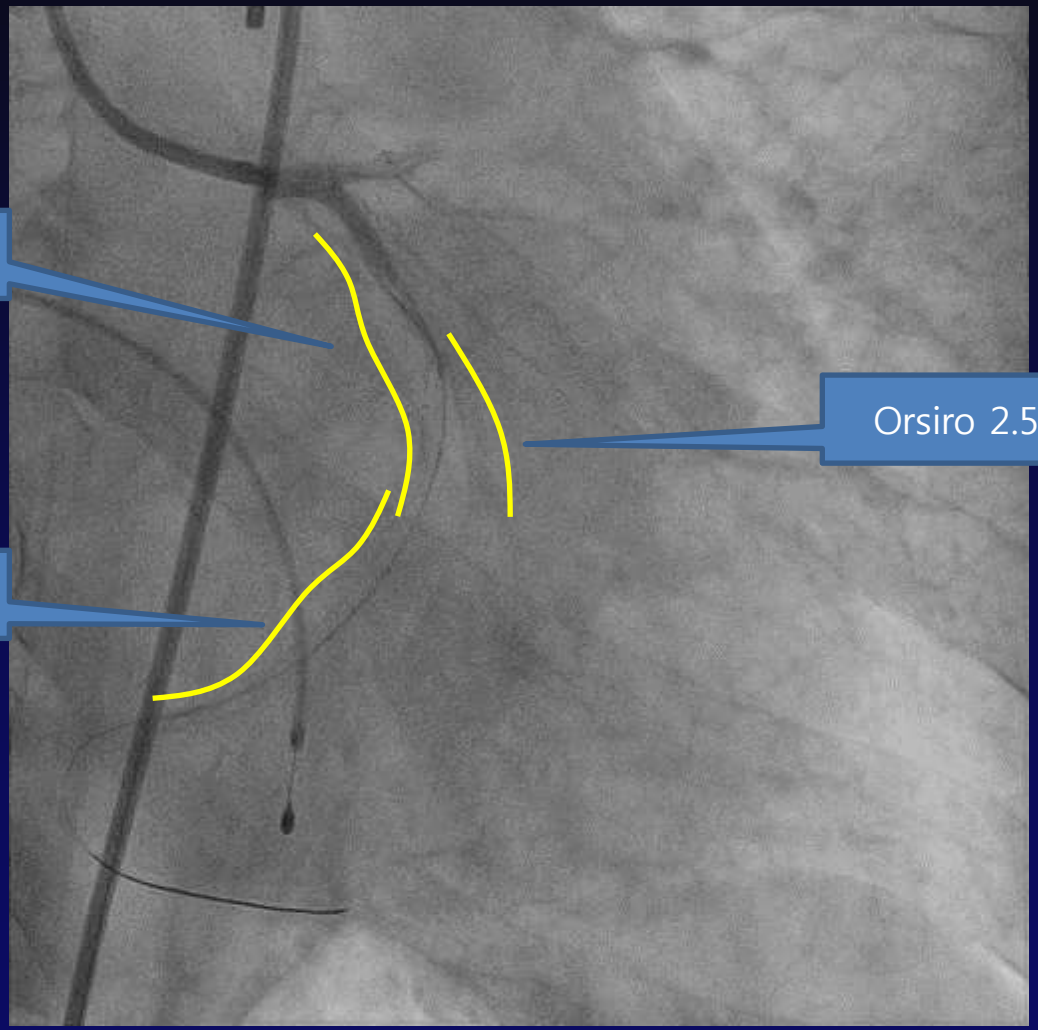
Case 2 – Unstable patient's hemodynamic status



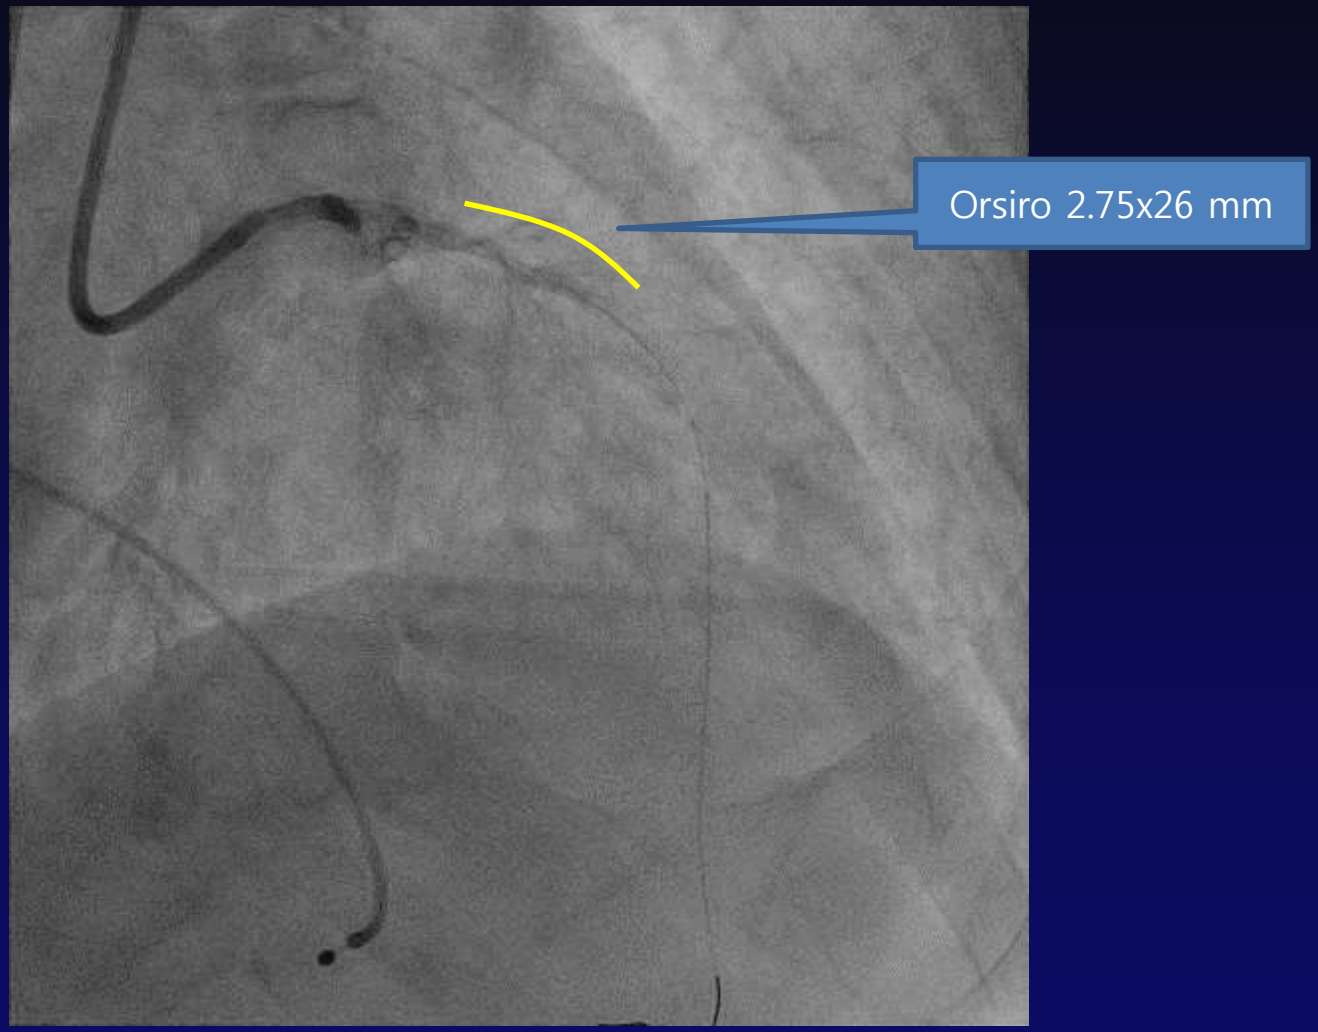
Case 2 – hypoplastic RCA



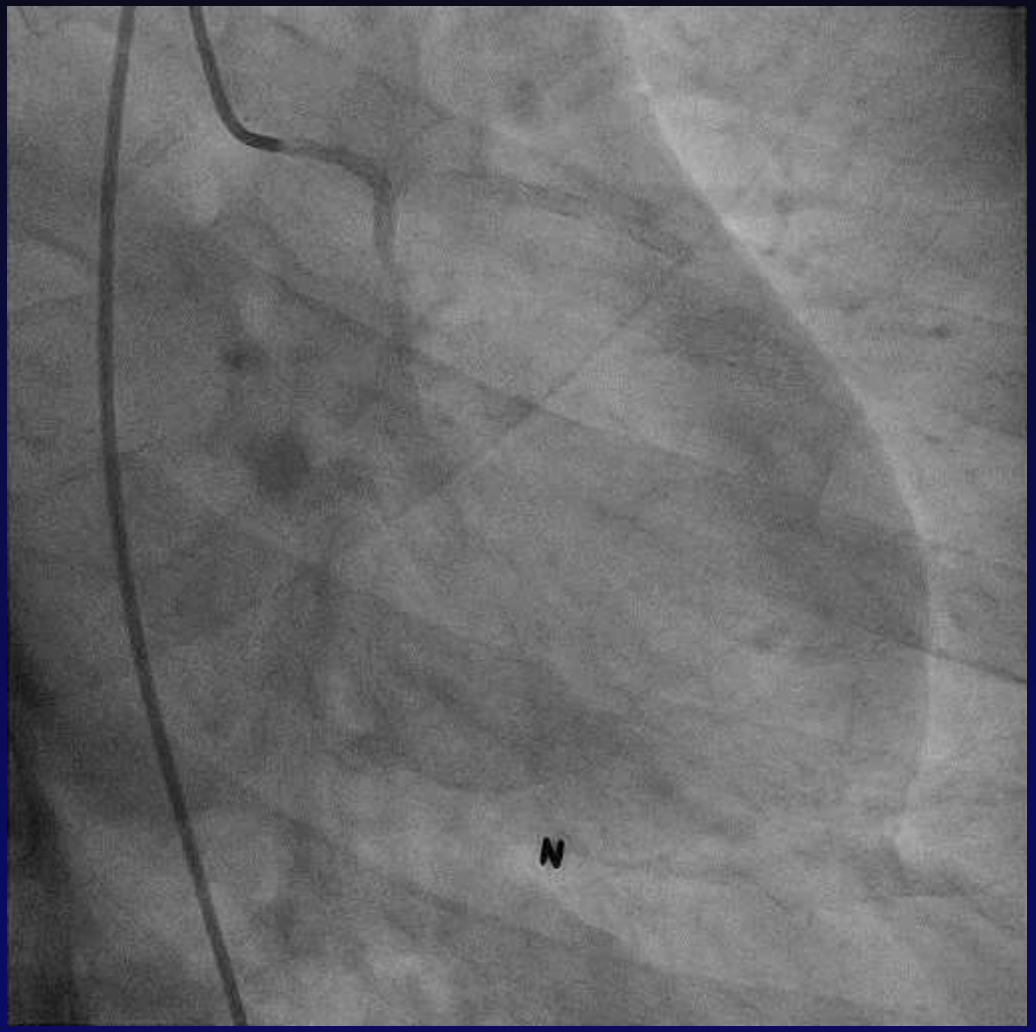
Case 2 – Three stenting to the large LCX



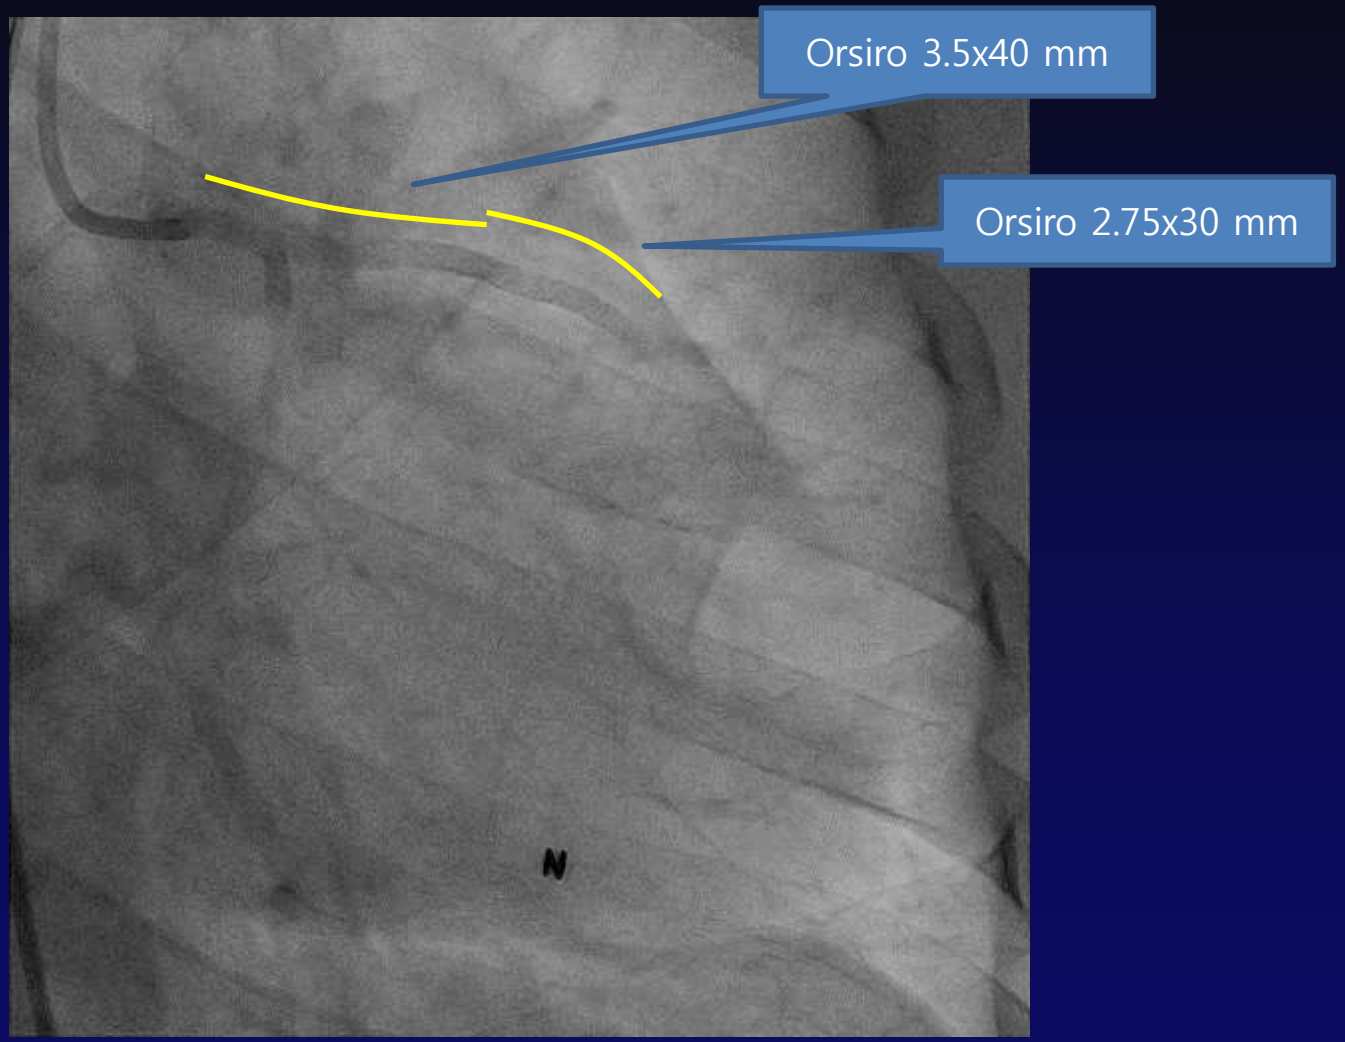
Case 2 – Reliable technical & procedural success rate → Reliable PCI device in high risk PCI casese



Case 3 – CTO, in-stent occlusion involving LM bifurcation

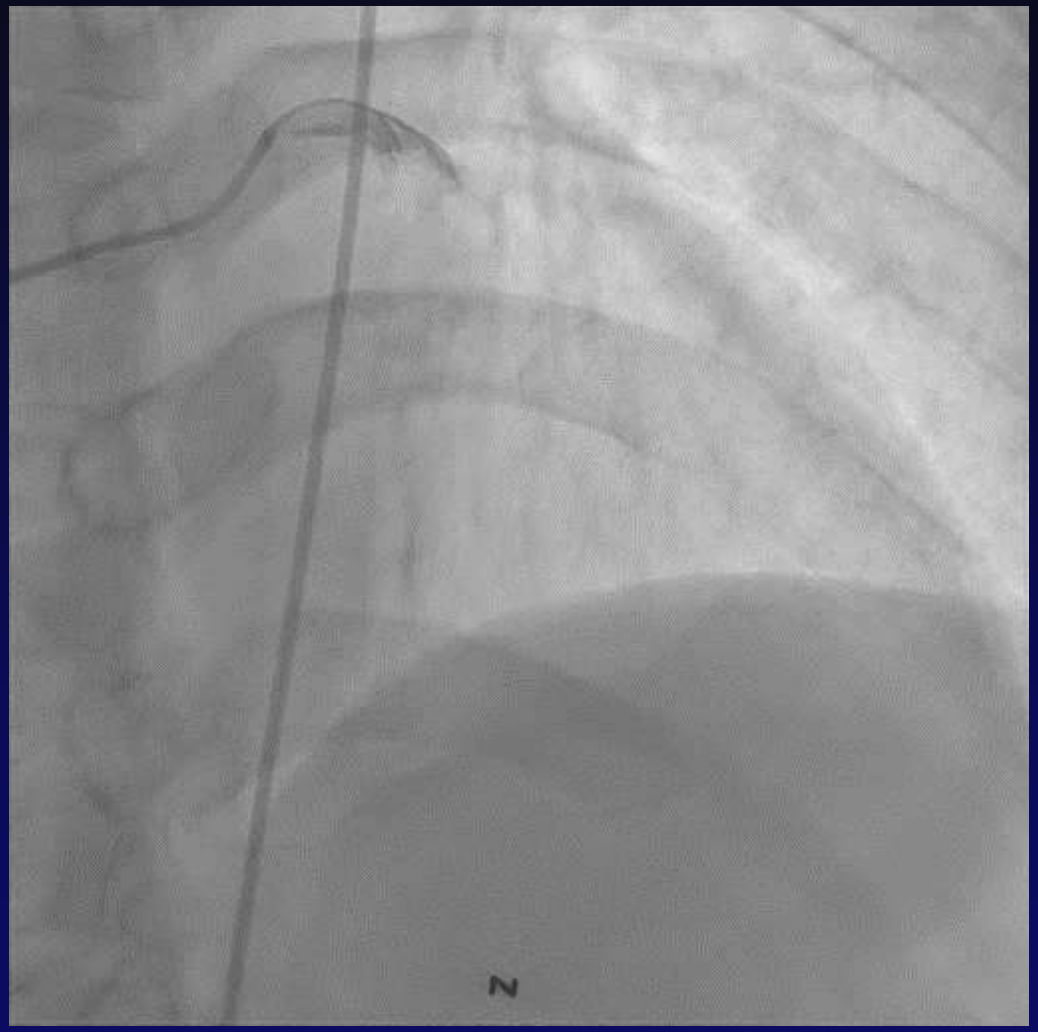


Case 3 – Reliable procedural success rate in complex PCI

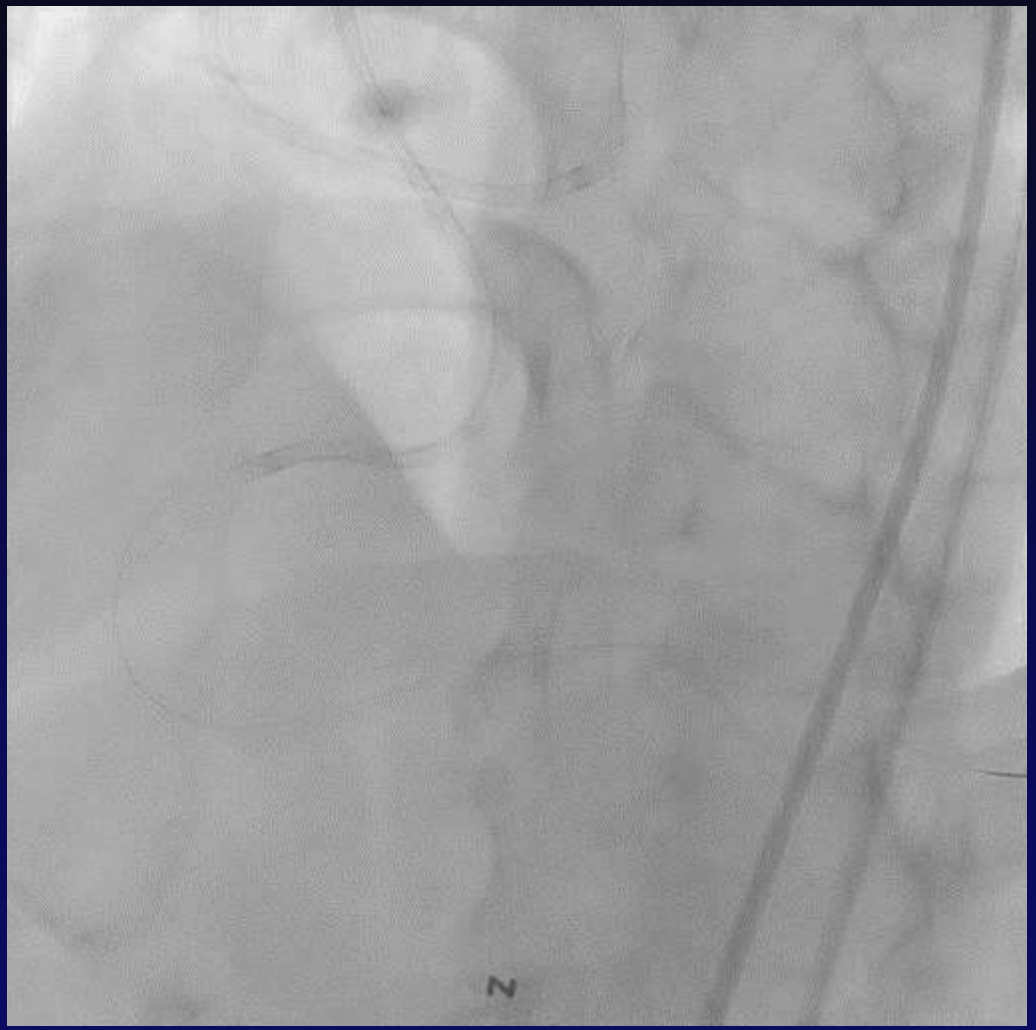


Case 4 – diffuse long thrombotic lesion

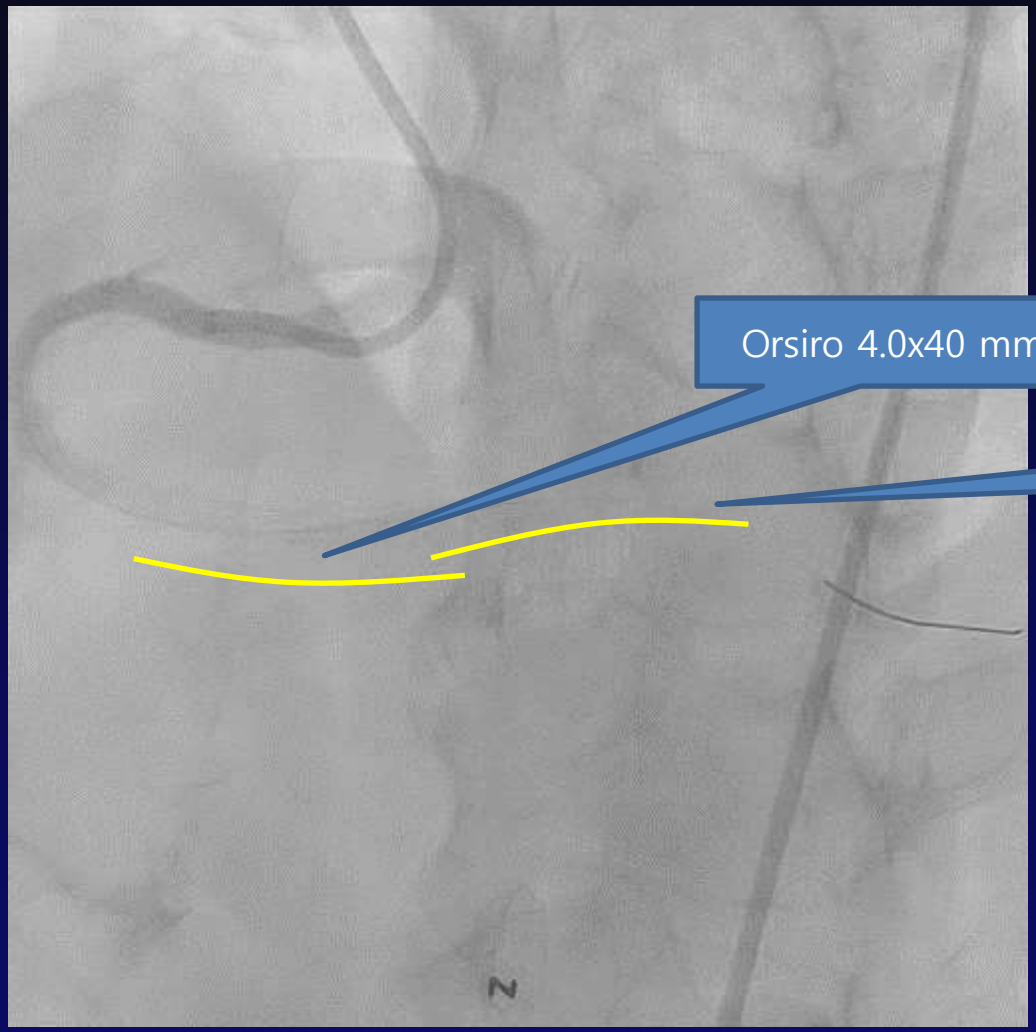
Case 4 – chronic total occlusion with a large distal bed



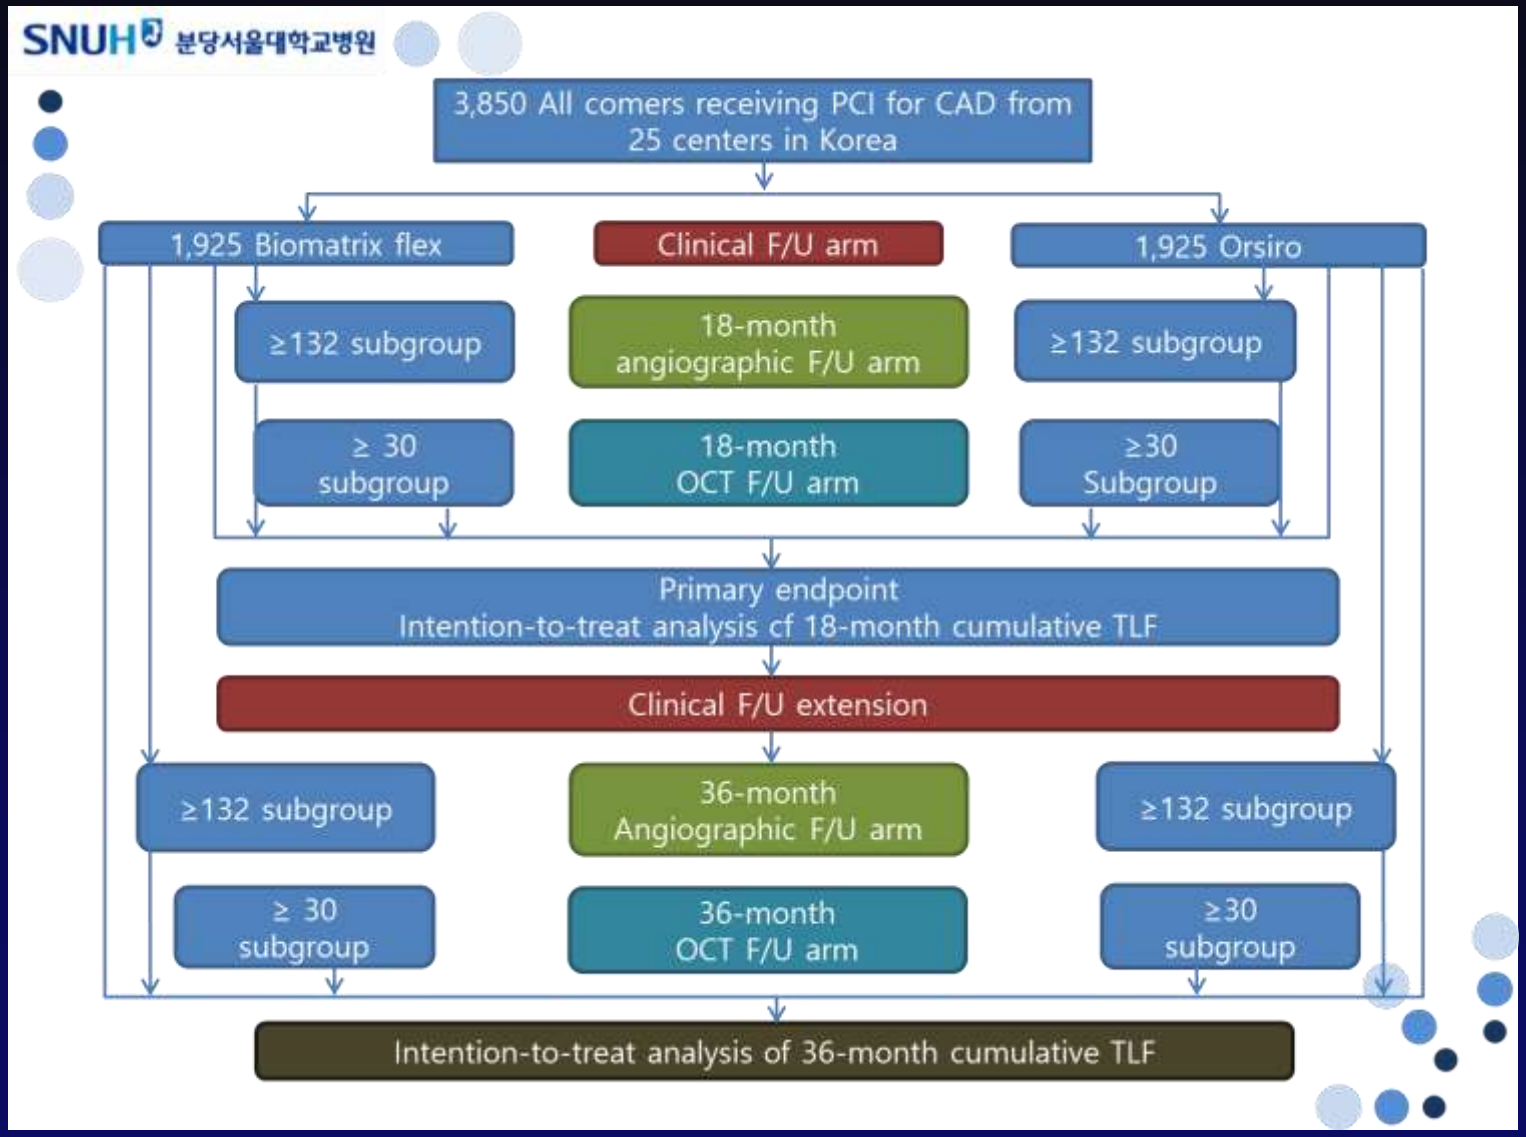
Case 4 – diffuse, long lesion with a large diameter



Case 4 – Just stent it ! With Orsiro



Ongoing RCT – BIODEGRADE



Current enrollment 2,120
