

Predicted and observed mortality at 10-year in patients with bifurcation lesion in the SYNTAX trial

**Kai Ninomiya, Patrick W. Serruys, Yoshinobu Onuma
for the SYNTAX Extended Survival Investigators**

**National University of Ireland, Galway
CORRIB CORE LAB**

Disclosure

Dr. Serruys reports institutional grants from Sinomedical Sciences Technology, SMT (Sahajanand Medical technological), Philips/Volcano, Xeltis, and HeartFlow, outside the submitted work.

Dr. Ninomiya reports a grant from Abbott Medical Japan outside the submitted work.

Dr. Morice is a CEO and shareholder of CERC, a CRO based in Paris, having no role in this trial.

Dr. Burzotta reports to have received speaker's fees from Abbott, Abiomed, Medtronic, Terumo.

All other authors have no conflict of interest to declare.

Objective and Method

Objective

To investigate the impact of bifurcation lesions on individual predicted and observed all-cause 10-year mortality in the SYNTAX trial.

Methods

1. The present study is a post-hoc subgroup analysis of the SYNTAXES study, which was an investigator-driven extended 10-year follow-up of the SYNTAX trial.
2. For the purpose of the present analysis, patients were categorized in four groups:
 - (A) Patients with the presence* of at least one bifurcation lesion in PCI group
 - (B) Patients without any bifurcation lesion in PCI group
 - (C) Patients with the presence of at least one bifurcation lesion in CABG group
 - (D) Patients without any bifurcation lesion in CABG group.

* On diagnostic angiogram

Baseline characteristics

	PCI			CABG		
	Patients without Bifurcation (N=248)	Patients with Bifurcation (N=649)	p Value	Patients without Bifurcation (N=239)	Patients with Bifurcation (N=651)	p Value
Age, yrs	63.5 ± 10.0	65.9 ± 9.5	< 0.001	63.7 ± 9.8	65.3 ± 9.8	0.030
Male	71.4 (177/248)	78.4 (509/649)	0.028	74.5 (178/239)	80.6 (525/651)	0.051
Body mass index, kg/m ²	28.1 ± 4.8	28.1 ± 4.8	0.961	28.1 ± 4.9	27.9 ± 4.4	0.606

Outcomes at 5-year Bifurcation vs non-bifurcation

Revascularization at 5-year

Number at risk	0	1	2	3	4	5
— (PCI with bifurcation)	649	526	494	459	418	251
- - - (PCI without bifurcation)	248	218	200	192	180	127
— (CABG with bifurcation)	651	560	527	506	476	295
- - - (CABG without bifurcation)	239	208	198	183	176	121

Death or stroke or MI at 5-year

Number at risk	0	1	2	3	4	5
— (PCI with bifurcation)	649	584	564	538	512	319
- - - (PCI without bifurcation)	248	235	224	216	200	138
— (CABG with bifurcation)	651	567	546	523	494	310
- - - (CABG without bifurcation)	239	212	205	199	194	135

All cause death at 10-year Bifurcation vs non-bifurcation

1-stent versus 2-stent technique

Number at risk

1stent	359	344	340	332	323	307	283	275	266	249	237
2stent	153	147	145	139	132	122	113	108	99	97	88

Clinical Outcomes

Based on **average treatment effect**, should you send all your **patients with bifurcation** to **Surgery**?

■ bifurcation ■ non-bifurcation

⇒ The answer is of course **no !!**

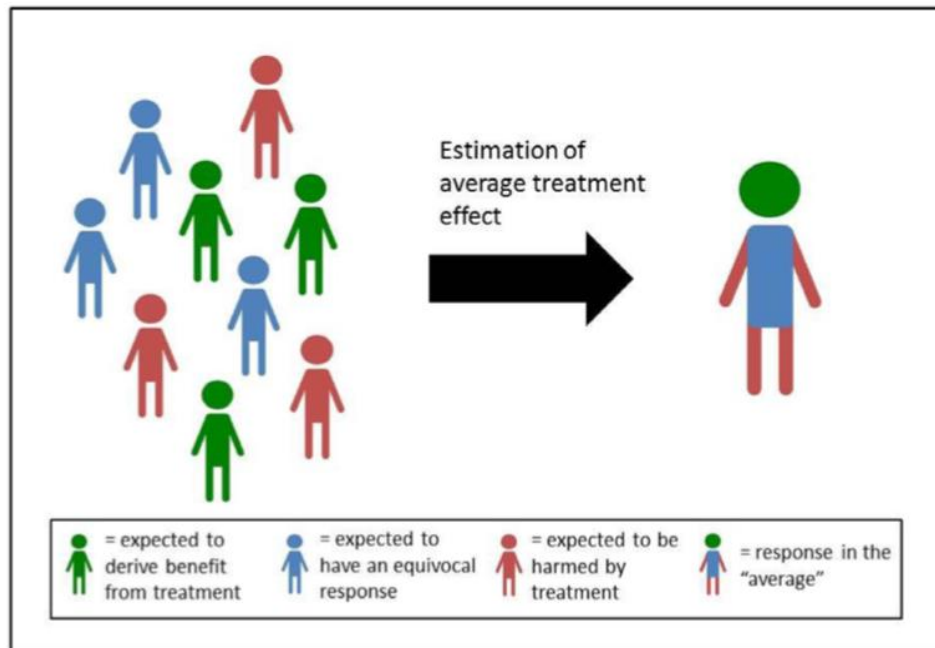

From average treatment effect to individualized prognosis

PERSPECTIVE

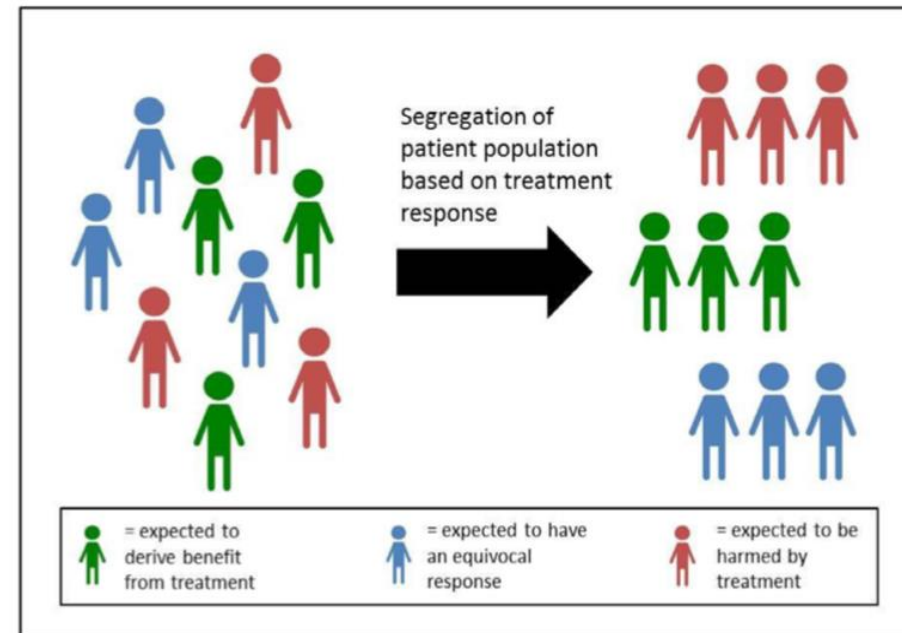

Decision Tools to Improve Personalized Care in Cardiovascular Disease

Moving the Art of Medicine Toward Science

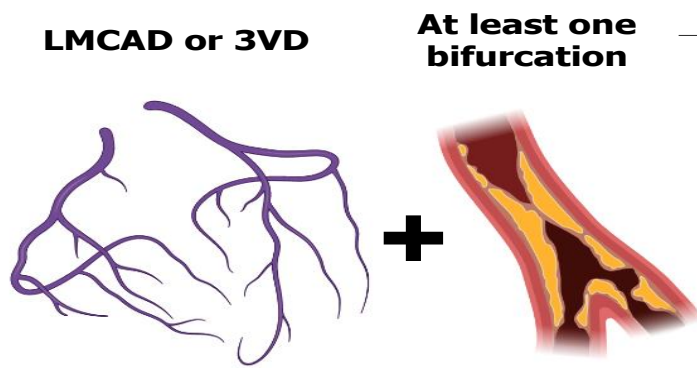

Average treatment effect assessed in clinical trials

Identification of heterogeneous responses to treatment

Individualized Predicted versus observed treatment benefit for 10-year mortality in bifurcation group

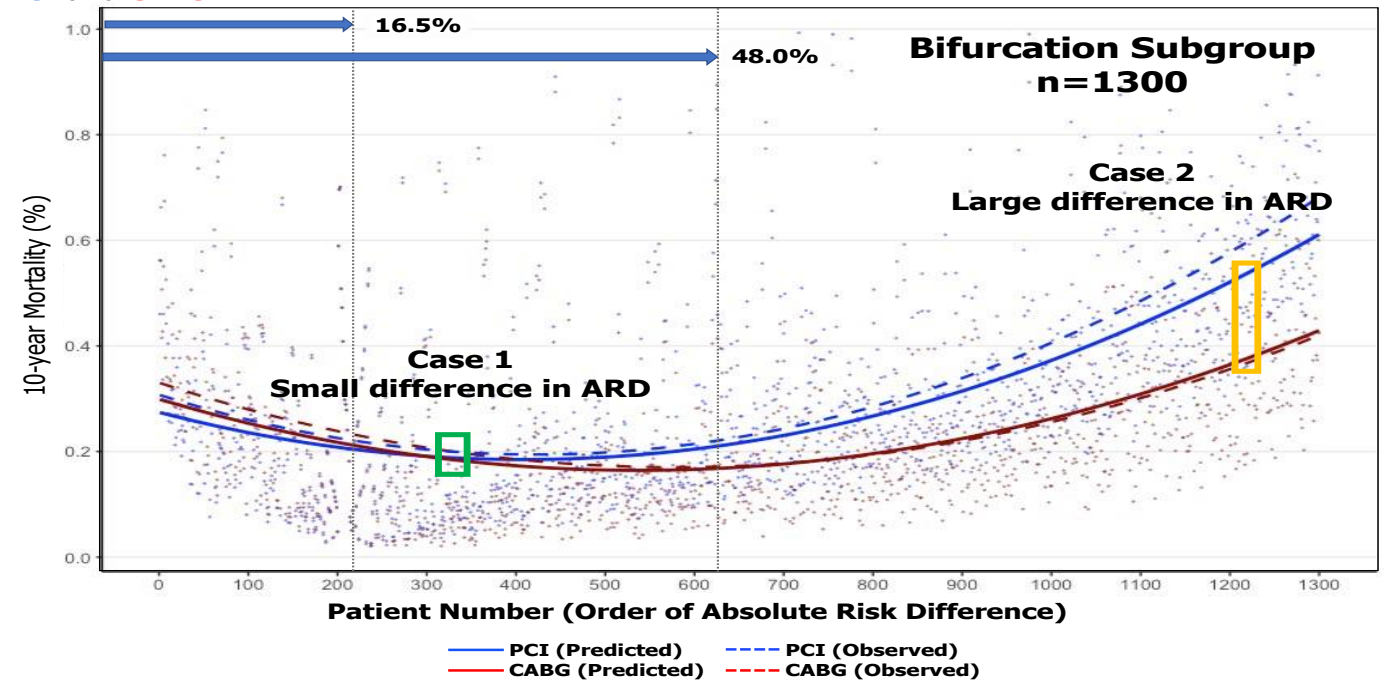

Case1	Case2
58	66
Yes	Yes
No	Yes
No	No
No	No
97	41
57	36
No	No
No	No
19	35

Age
Diabetes
On Insulin
PVD
COPD
Creatinine clearance
LVEF
Current smokers
LMCAD
SYNTAX score

*ARD= (10 year mortality of PCI) – (10 year mortality of CABG)

Case 1

Predicted Mortality

Equipose of PCI and CABG

Observed Mortality

Equipose of PCI and CABG

Can be referred for either PCI or CABG

Case 2

Predicted Mortality

CABG Better

Observed Mortality

CABG Better

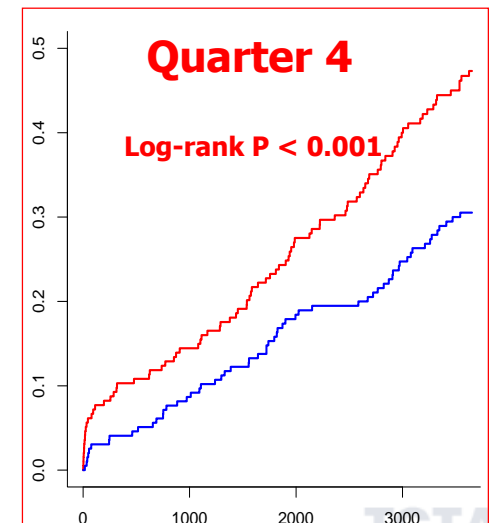

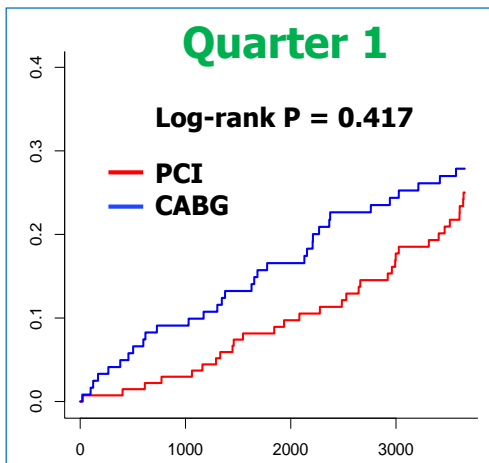

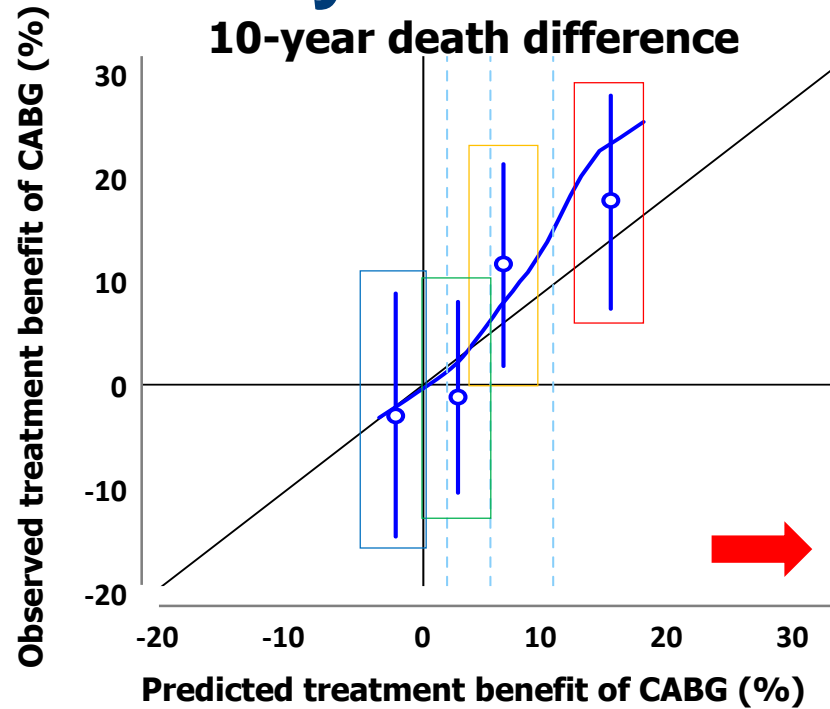

CABG should be recommended

Individualized Predicted versus observed treatment benefit for 10-year mortality in bifurcation group

Observed CABG better

Observed PCI better

Conclusion / Take-home Message

- Bifurcation lesion(s) require specific attention from the heart team when deciding between PCI and CABG, considering the overall higher all-cause mortality associated with PCI at long-term.
- Careful evaluation of the bifurcation PCI complexity (anticipated need for 2-stent) and evaluation of individualized 10-year vital prognosis using the SS-2020 might be helpful in the decision-making process.
