

# **Synergetic Approach for Discordant Lesions Between FFR and Hyperemia Free Index**

Jung-Min Ahn, MD

Heart Institute, University of Ulsan College of Medicine  
Asan Medical Center, Seoul, Korea

# How To Detect Objective Ischemia

- During **Stress**, Decreased Coronary Blood Flow

Myocardial Perfusion Abnormality

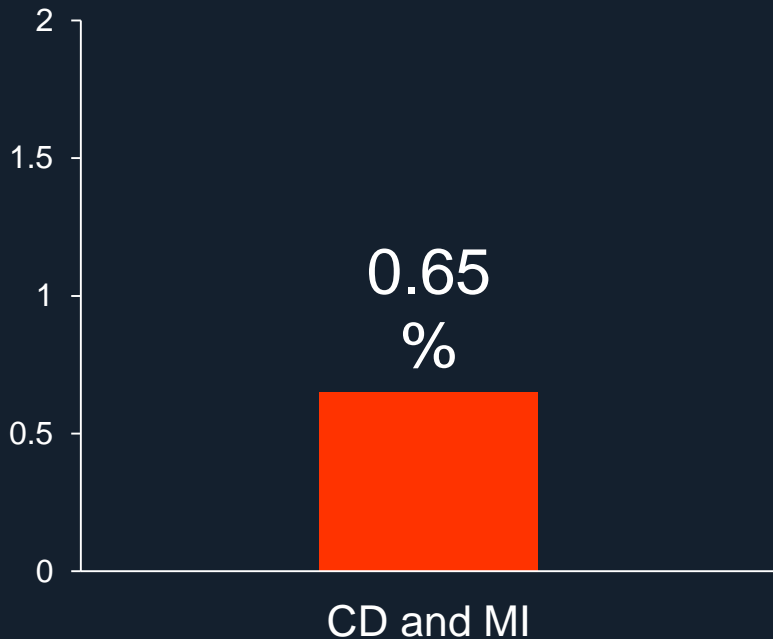

Contractile Abnormality

Electrical Abnormality

# Negative Test, Excellent Prognosis

## Negative Exercise Myocardial Perfusion

Journal of Nuclear Cardiology, 11(5), 551-561

## Survival Benefit of CABG Over Med.

DONALD AW et al. J Am Coll Cardiol 1986;8:741-8

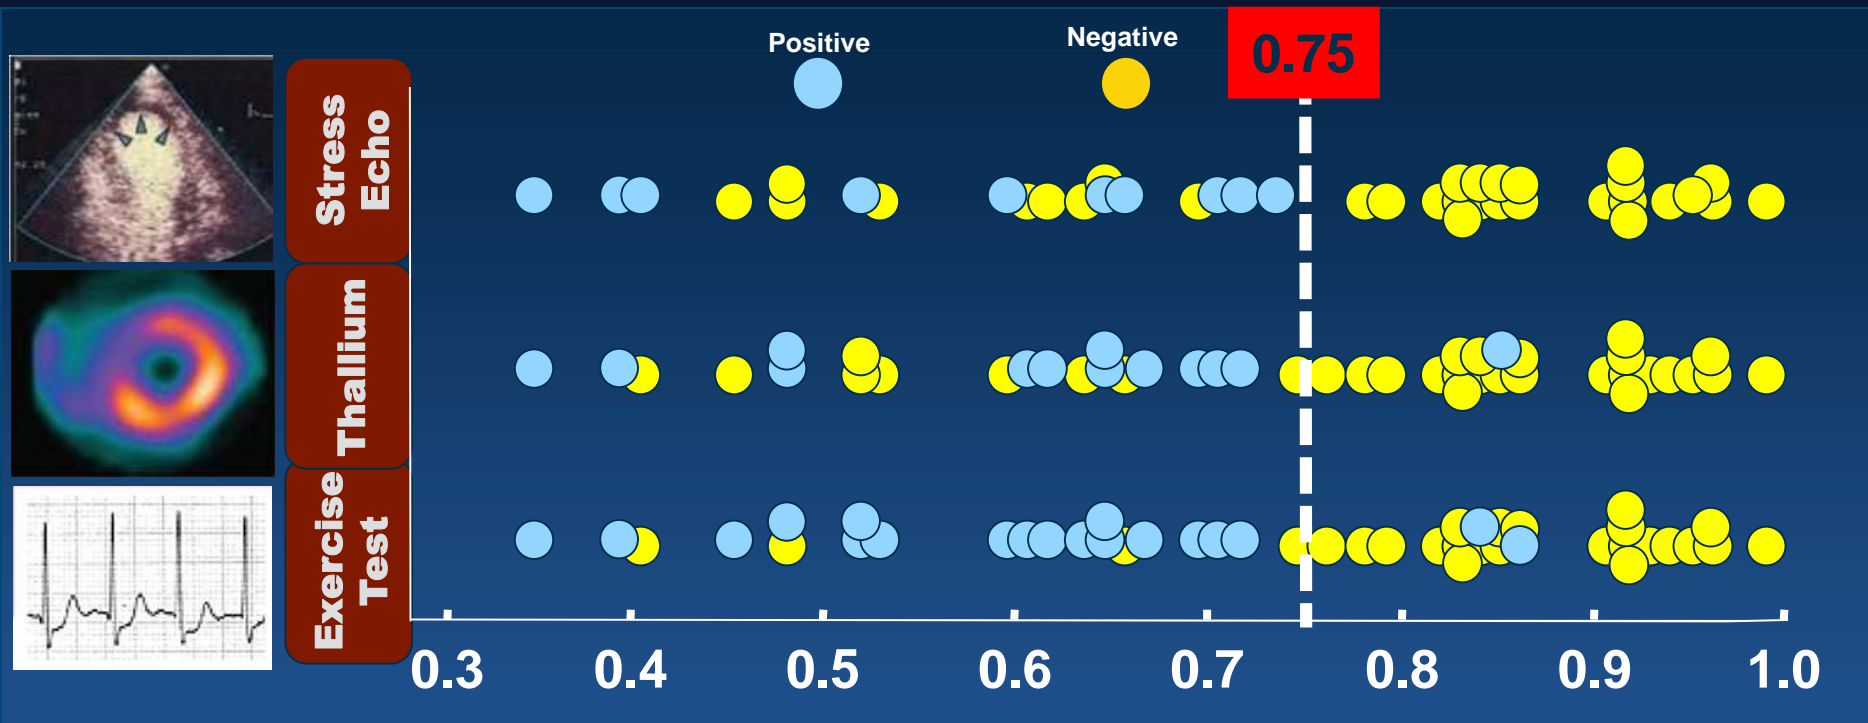

# Non-Invasive Functional Study

## *Limitations*

- Low frequency of performing stress test
- False negative or positive results
- Low spatial resolution
- Limited in the multivessel assessment
- Limited in the non-culprit lesion assessment in ACS
- Further resources and experts are necessary

# Non-Invasive Study In Cath Lab

Comparison with 3 non-invasive functional studies

- N = 45 patients
- Sensitivity 88%, Specificity 100%, PPV 100%, NPV 88%

**FFR**

# FFR Guided PCI (FAME I)

$\leq 0.80$  (*FAME II*)

- ✓ Myocardial Ischemia producing
- ✓ Stenting

$>0.80$  (*DEFER, >0.75*)

- ✓ Not Myocardial Ischemia producing
- ✓ Optimal Medical Treatment
- ✓ Deferral of Stenting

# ESC Guideline 2018

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
When evidence of ischaemia is not available, <b>FFR or iwFR</b> are recommended to assess the haemodynamic relevance of intermediate-grade stenosis. <sup>15,17,18,39</sup>	<b>I</b>	<b>A</b>
FFR-guided PCI should be considered in patients with multivessel disease undergoing PCI. <sup>29,31</sup>	<b>IIa</b>	<b>B</b>
IVUS should be considered to assess the severity of unprotected left main lesions. <sup>35–37</sup>	<b>IIa</b>	<b>B</b>

# Non-Hyperemic Pressure Ratio (NHPR)

# Pressure Derived Physiologic Index, 2019

**Hyperemic Index: FFR**

**Non-Hyperemic Pressure Ratio (NHPR)**

Resting Pd/Pa: 0.91 (or 0.92)

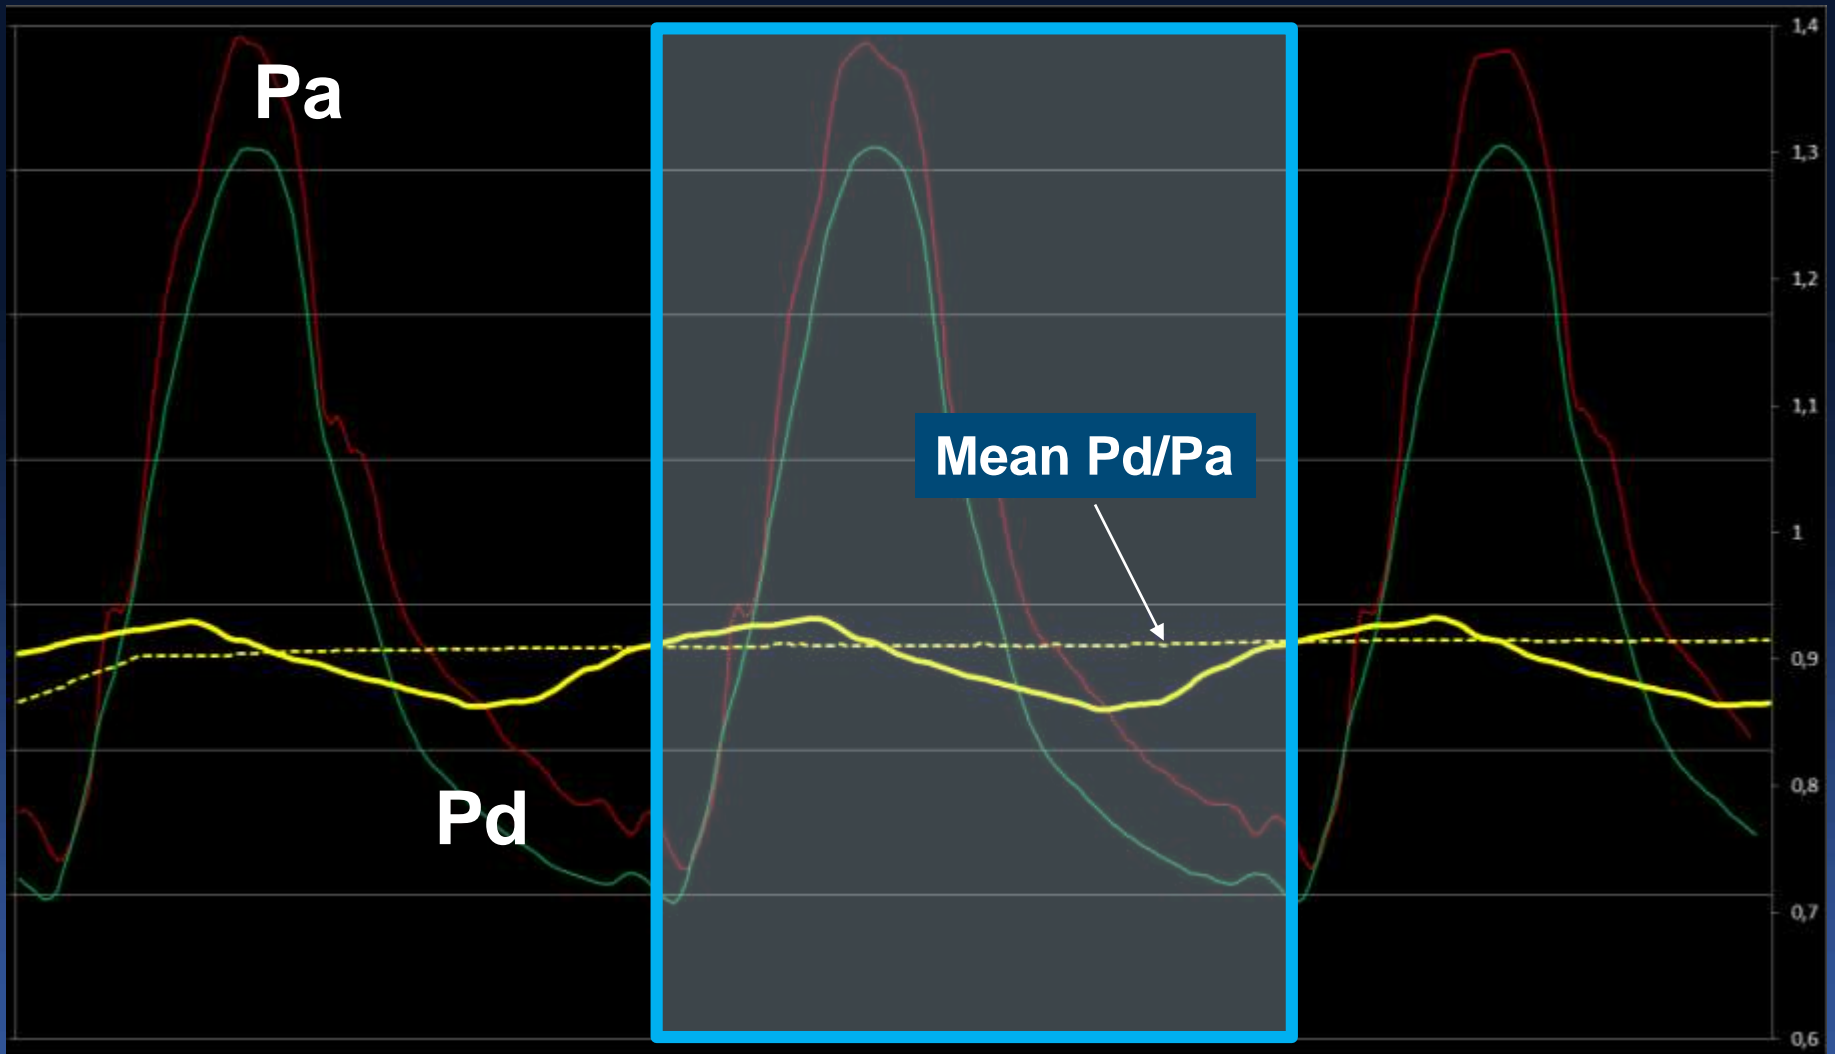

iFR: 0.89

dPR (Diastolic pressure ratio): 0.89

RFR (Resting full-cycle ratio): 0.89

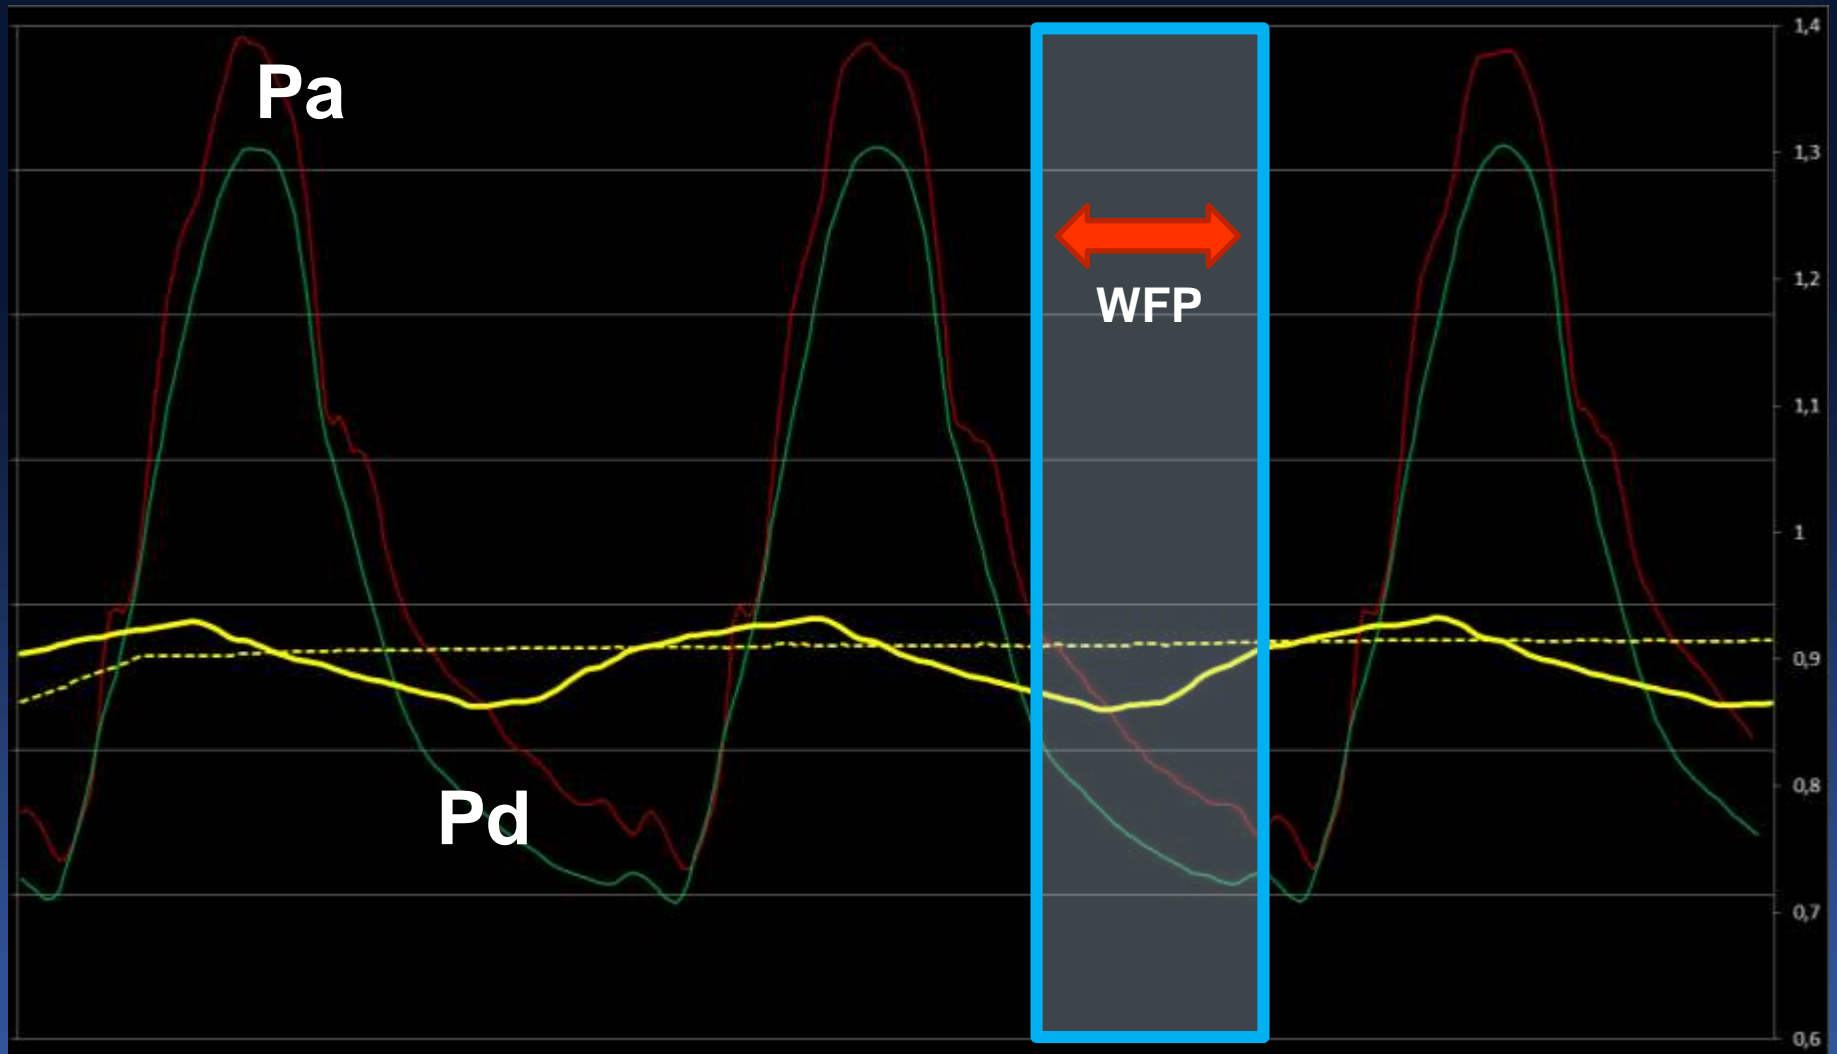

DFR (Diastolic hyperemia-free index): 0.89

# Resting Whole Cycle Pd/Pa

Average Pd/Pa during the entire cardiac cycle

# iFR (instantaneous Wave-Free Ratio)

Average Pd/Pa during wave free period (WFP)

# $dPR_{dia}$ ( Diastolic Pressure Ratio)

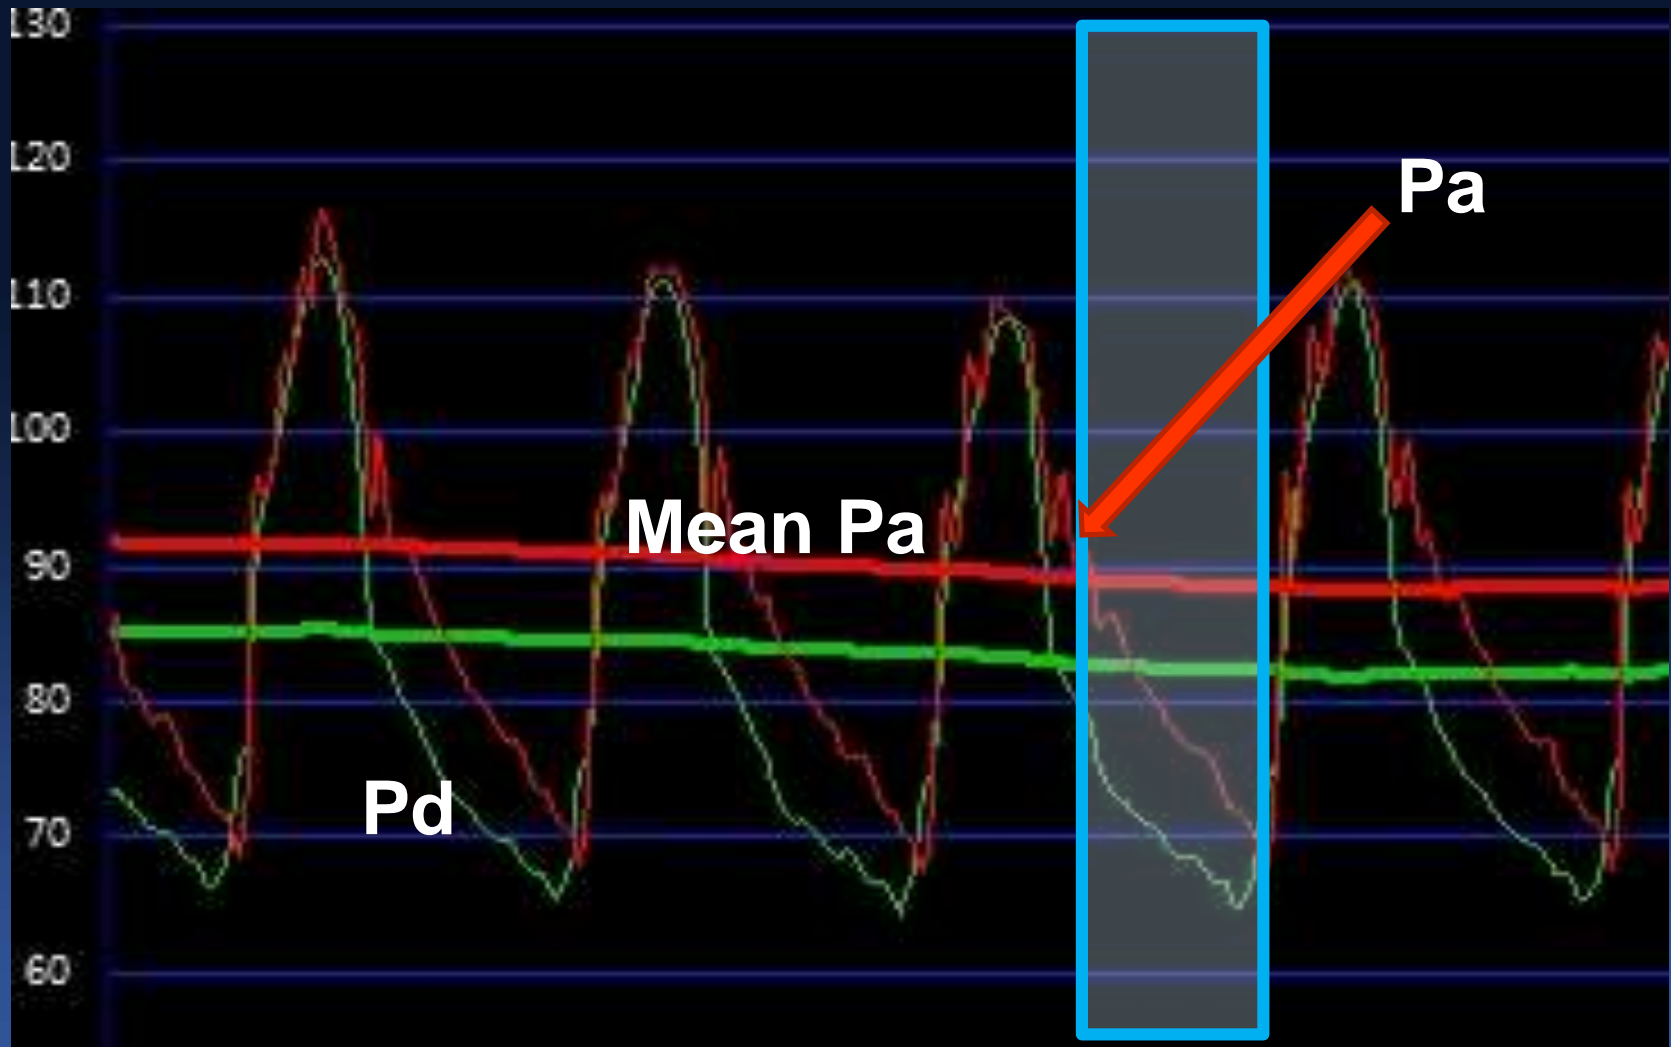

Average Pd/Pa during the entire diastole

# RFR (Resting Full-cycle Ratio)

Lowest Instant Pd/Pa ratio during the entire cardiac cycle

# DFR (Diastolic Hyperemia Free Ratio)

Average Pd/Pa during the period

**Between Pa < mean Pa AND down-sloping Pa**

# IRIS-FFR Registry

2301 lesions in 1851 patients  
With valid resting and hyperemic raw pressure tracing ( $\geq 5$  beats)

1329 lesions were **deferred** after physiologic assessment

**Low Sensitivity**

# Accuracy and Selective Adenosine Use

## Resting Pd/Pa

# Positive/Negative Predictive Value

# Summary

- NHPRs do not represent resting flow but is a surrogate of FFR
- All NHPR (resting Pd/Pa, iFR, dPR, RFR, DFR) showed equivalent diagnostic and prognostic performance.
- Overall concordance rate between NHPR and FFR was about 80-85%%.
- Use of a hybrid strategy with selective adenosine use improve agreement rate between FFR and NHPR by > 90%
- That integration of NHPR and FFR identified unique clinical, physiologic, and prognostic phenotype of patients.
- However, for NHPRs to be clinically relevant physiologic indexes, further study should evaluate their own physiologic meanings.
- **New Data: discordant lesion prognosis will be presented at 5:16 PM on Monday, 29<sup>th</sup> April.**
