

Imaging & Physiology Summit FFR Workshop

HYPEREMIA

Seoul, Korea, december 6th, 2013

Nico H. J. Pijls, MD, PhD
Catharina Hospital,
Eindhoven, The Netherlands

Disclosures:

- Dr Pijls received institutional research grants from St Jude Medical and Maquet and is consultant for St Jude Medical
- Dr Pijls has equity interest in Philips, General Electric, and Heartflow

Is Hyperemia Mandatory ?

For practical reasons, it is advocated presently by some investigators to skip hyperemia,
as defended by Dr Matsuo

Why Are Resting Indices Insufficient ?

- *Limited Clinical Significance*
- *iFR is at odds with experimental validation*
- *resting gradients poorly predict hyperemic gradients*
- *Resting Conditions Are Very Hard to Obtain*
- *Large gray zone*
- *no independent outcome data*
- *cumbersome pullback recording*

Why Are Resting Indices Insufficient ?

- *Limited Clinical Significance*
- *iFR is at odds with experimental validation*
- *resting gradients poorly predict hyperemic gradients*
- *Resting Conditions Are Very Hard to Obtain*
- *Large gray zone*
- *no independent outcome data*
- *cumbersome pullback recording*

$$\Delta P = f.Q + s.Q^2$$

f = friction coefficient

Moderate gradient at rest

Moderate increment at hyperemia

s = separation coefficient

Small gradient at rest

Large gradient at hyperemia

70% long prox LAD stenosis

iFR = 0.89 FFR = 0.85

50% ostial left main stenosis

iFR = 0.94 FFR = 0.57

In general:

- small perfusion territory, distal stenosis, older patient, moderate long lesion, small artery, microvascular disease:
 - *often moderate gradient at rest with little increase at hyperemia*
- large perfusion territory, proximal stenosis, young patient, short lesion, large artery, good microvasculature:
 - *often minimal gradient at rest with large increase at hyperemia*

Especially these lesions are missed by resting indexes

Male 46 years old, PressureWire in RCA

Why Are Resting Indices Insufficient ?

- *Limited Clinical Significance*
- *iFR is at odds with experimental validation*
- *resting gradients poorly predict hyperemic gradients*
- ***Resting Conditions Are Very Hard to Obtain***
- *Large gray zone*
- *no independent outcome data*
- *cumbersome pullback recording*

Resting Conditions Are Very Hard to Obtain

- it is illusionary to believe that true resting conditions exist in a conscious human in the cath lab

- in fact, the only condition which can be reliably obtained in the cathlab, is ***maximum hyperemia***:
it is more difficult to create true resting conditions than true hyperemia !!

verification of equal pressures and absence of drift

iFR = 0.89
 $P_d/P_a=0.90$

iFR = 0.84
 $P_d/P_a=0.87$

iFR = 0.76
 $P_d/P_a=0.80$

FFR = 0.69

what is “resting”?

nothing is so variable in the cathlab as “resting”

→ obtaining true resting conditions in a conscious patient in the catheterization laboratory, is illusionary.....

.....and as a consequence, large variation in cut-off values to detect ischemia are found for resting indices:

Traditional CFR: ischemic threshold varies from 1.6 to 3.5

iFR: 0.83 (Advise study, Sen et al)

0.88 (Koo et al)

0.90 (Jeremias et al)

Similar for all indexes which rely upon resting value of flow

Why Are Resting Indices Insufficient ?

- *Limited Clinical Significance*
- *iFR is at odds with experimental validation*
- *resting gradients poorly predict hyperemic gradients*
- *Resting Conditions Are Very Hard to Obtain*
- *Large gray zone between ischemic and non-isch values*
- *no independent outcome data*
- *cumbersome pullback recording*

Probability that treatment decision will change if the respective index measurement is repeated

Classification certainty of single measurement

FFR

FFR < 0.75

0.75

0.80

FFR > 0.80

— FFR, VERIFY study

2.4 % of patients go from green to gray or v.v. and 2.4 % from red to gray
Almost nobody ever crosses from red to green or v.v.

FFR (Fractional Flow Reserve)

Probability that treatment decision will change if the respective index measurement is repeated

Classification certainty of single measurement

- FFR, VERIFY study (coefficient of variation 2.4 %)
- iFR, ADVISE study (coefficient of variation 6.1 %)

Why Are Resting Indices Insufficient ?

- *Limited Clinical Significance*
- *iFR is at odds with experimental validation*
- *resting gradients poorly predict hyperemic gradients*
- *Resting Conditions Are Very Hard to Obtain*
- *Large gray zone*
- *no independent outcome data
(only retrospective data or non-inferiority studies)*
- *cumbersome pullback recording*

RESOLVE STUDY:

- Largest registry comparing the different resting indexes to FFR as a gold standard
- 1768 patients
- independent analysis by core-lab of CRF
- *no difference between different resting indexes*
- *agreement rate with FFR ~ 80 %*

RESOLVE study (N=1768)

I can't see the wood for the trees !

Pullback recording is cumbersome without hyperemia

- *poor signal to noise ratio*
- *time consuming because no fluent pullback but multiple interruptions*
- *multiple numbers, small differences, difficult interpretation*

In conclusion:

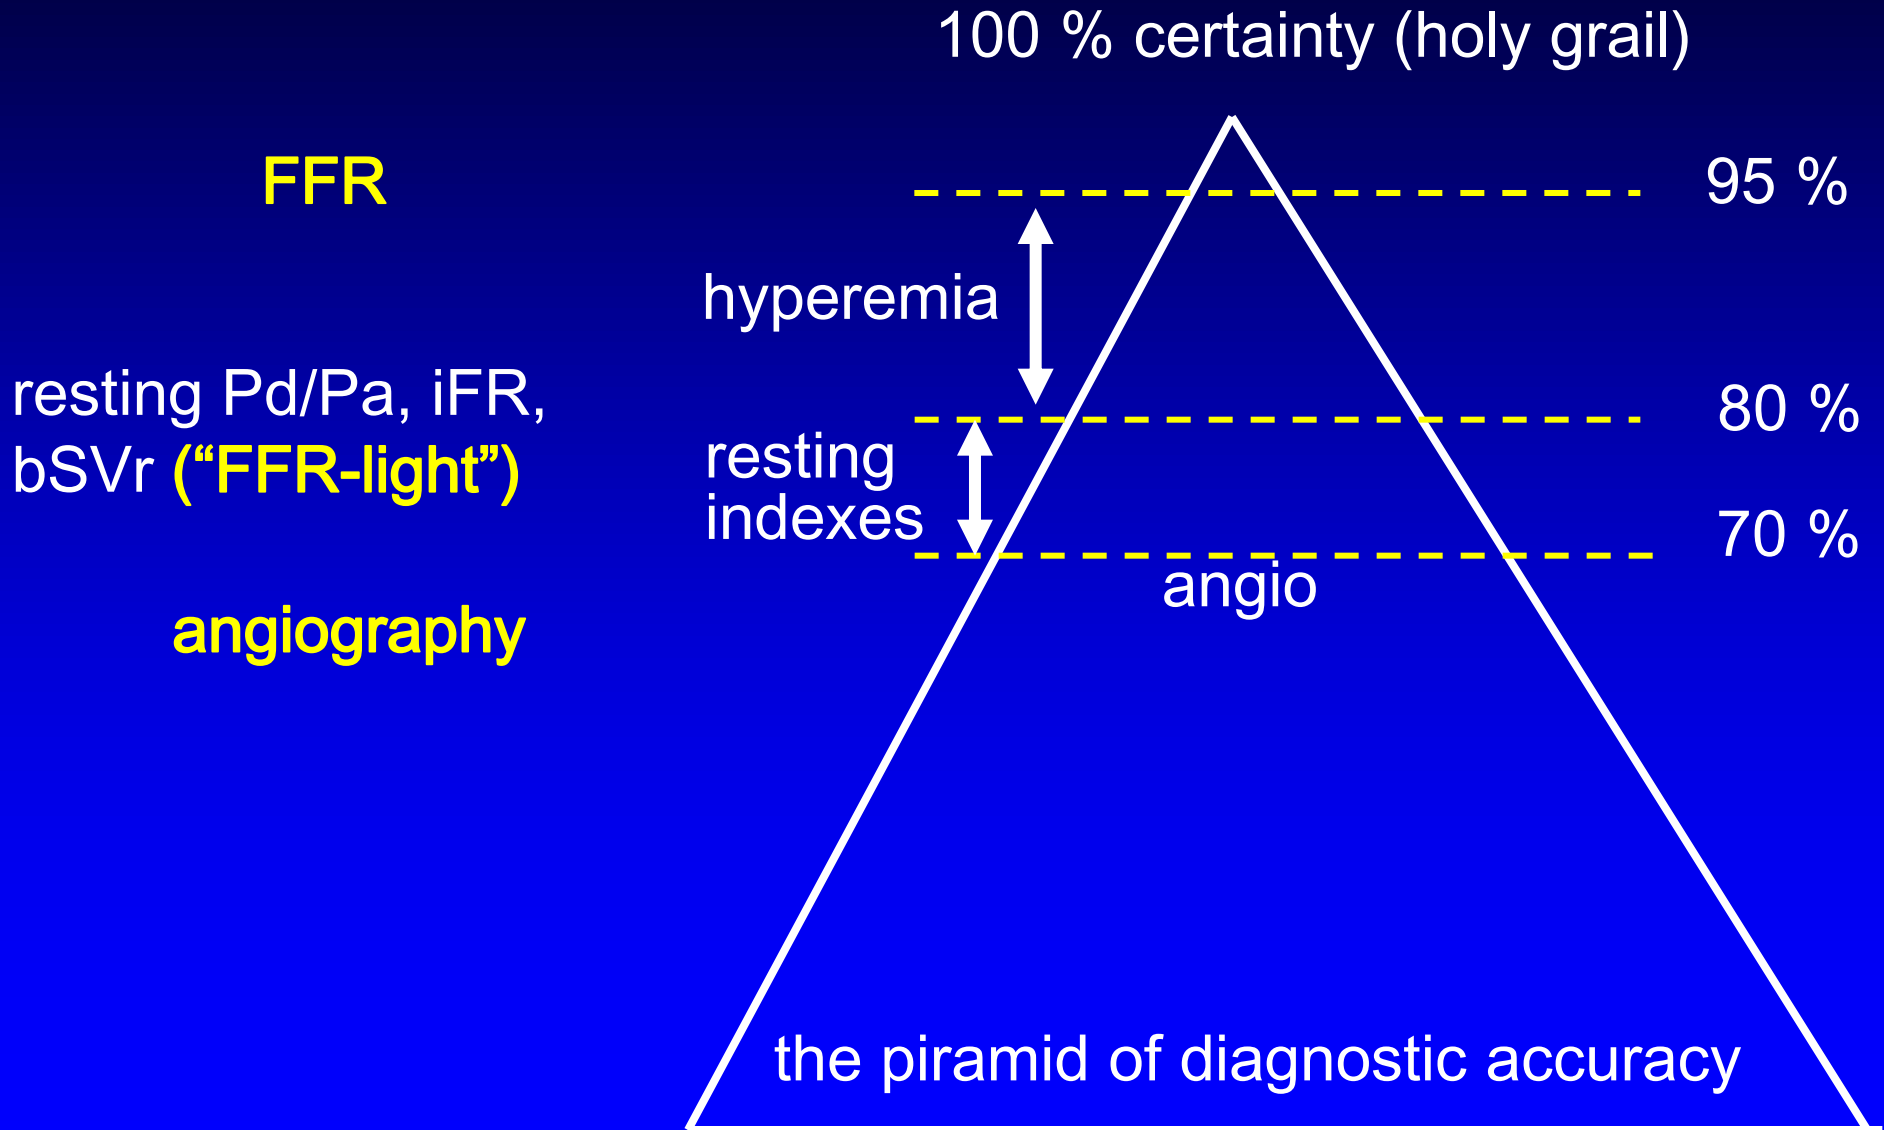

Is Hyperemia Essential ??

Is Hyperemia Essential ??

Yes, it is !!

Correct Classification of Ischemic Stenosis

HYPEREMIA MANDATORY ? → YES !

- Leaving away (full) hyperemia, means decrease of accuracy and false decision making in 20% of patients. With so-called “hybrid” approaches (i.e. hyperemia in part of the patients) 10% false decisions
- *Does a few minutes of extra work and a very moderate saving of money for a hyperemic drug justify a wrong decision in 1 out of every 5-10 patients?*

For us, PCI might be routine....

.....for the patient, it is a big deal!

Therefore, we should do it in the best possible way !

EINDE

Why Are Resting Indices Insufficient ?

- *large gray zone and limited accuracy of P_d / P_a at rest and iFR compared to FFR*

Equalization before entering LCA

“Non-hyperemic indexes”

A collection of older and newer resting indexes derived from pressure measurement at rest:

Pd/Pa at rest, diastolic Pd/Pa, iFR, i-FFR

which have in common that they

- all try to avoid hyperemia
- are not independently validated
- and only have a moderate accuracy (70% -80%) compared to FFR
- questionable underlying scientific assumptions

Why Are Resting Indices Insufficient ?

- Limited Clinical Significance
- **Limited Physiological Meaning**
 - poor scientific background
 - no experimental validation
 - deny the fluid-dynamic equation

LET OP:

Vanwege de tijd kun je wrschl beter de volgende
5 dia's weglaten!!!!!!!

Volumetric coronary blood flow

Q_{phasic}

- 200 ml/min

- 0

20 sec occlusion

Q_{mean}

In the presence of constant coronary pressure

$$\longrightarrow R \sim 1 / \text{Flow}$$

coronary occlusion

minimal myocardial resistance during the so-called “wave-free period” is ~ 250 % higher than average myocardial resistance at maximum hyperemia in all dogs and swine

coronary occlusion

REST

HYPEREMIA

$iFR = P_d / P_a$ during WFP \rightarrow strongly dependent on hyperemia

profound influence of hyperemia on iFR:

“iFRhyp” was already called diastolic FFR by Abe et al in *Circulation*, 1996)

estimated decrease of resistance during “wave-free period”

$$\frac{(1.0 - 0.64)}{(1.0 - 0.82)} = \mathbf{200\%}$$

“resting” pullback recording with multiple iFR:
time-consuming, less reliable, poorly detailed information

Is it necessary to use hyperemia ?

Simple intermediate solution ??

→ **Pd/Pa_{contrast}®** , or cFFR

→ Several small studies presented at PCR

→ ***Presently ongoing CONTRAST STUDY***

Principal investigators: Dr Nils Johnson, TMC

Dr Bill Fearon, Stanford

Correct Classification of Ischemic Stenosis

ROC Curve iFR and Pd/Pa Based on FFR 0.80

MAXIMUM VASODILATORY STIMULI

!! Maximum hyperemia is paramount !!

- PAPAVERINE i.c.
- ADENOSINE i.c.
- ADENOSINE i.v. infusion
- ATP i.c
- ATP i.v.
- REGADENOSON i.v. bolus

Why Are Resting Indices Insufficient ?

- **Limited Clinical Significance**

In patients with Coronary Artery Disease, resting flow and gradients have little meaning....

...Angina pectoris occurs and the myocardium becomes ischemic as soon as **maximum achievable blood flow** is insufficient to match oxygen demand

*Therefore, looking at maximum flow (as a fraction of normal maximum flow), makes most sense and is the basis of Fractional Flow Reserve (**FFR**)*
